

Solutions for making Samsung devices work on Xmodgames 1.2.1

Xmodgames 1.2.1 for android is not working on some Samsung devices at present. If your Samsung device cannot use XMG 1.2.1, please check "SE for Android status" in Setting > About Device. In "Enforcing" mode, the mod CANNOT be loaded(ONLY happens on android 5.0 and above), while in "Permissive" mode, the mod is working. We haven't solved the "Enforcing" mode issue at present, but we will try our best. And we've collected some solutions for changing the SE from "Enforcing" to "Permissive", which are for reference only. Really sorry for the inconvenience caused.

Important: The following solutions are collected from our Xmodgames users, which are for reference only. Be carefully, any misoperation may brick your device.

▲ Solution 1 (Recommended)(by Jonathan Mohamed)

FIX SE LINUX ENFORCING ISSUE WITHOUT FLASHING CUSTOM KERNEL FOR SAMSUNG GALAXY PHONES!!!

- 1.) Clear Data of Xmod Games.....{settings/applications_manager/xmod}
- 2.) <http://goo.gl/m2K4Zf>...Download, install, run.....{fixes permission issues}
- 3.) <http://bit.ly/1aaUDI1>...Download, install, run...use it to CONVERT xmod to SYSTEM (click tools then "Move to system/app"), not to SD but to SYSTEM
- 4.) Reboot, Launch xmod and grant root, install mods and success!
- 5.) If still not working go to "settings/application_manager/all/xmod"...clear data,and reboot.

Solution 2 (by Mario Bernardini)

A guide on how to install a package that will change the kernel of your device Galxy s5 samsung android 5.0. This amendment will allow xmodgames working. download Odin on your

PC:<http://odindownload.com/downloads/Odin-V3.10.6.exe>, after installing odin you will have to download another file that will serve to simplify the BIOS interface of the device:

https://goo.im/devs/philiz_touch/CWM_Advanced_Edition/klte/philiz_touch_6.26.1-klte.tar.md5/ once downloaded you will go on your PC and it will install via Odin. download directly from your dispositivo:

<https://www.dropbox.com/s/eigqknnsnx53bc8/arter97-kernel-klte-5.0.1.zip?dl=0>

after installing philz_touch, turn off your device after turning it off turn it on again while holding the key with which you increase the volume button + Home + Power, try: install zip, download, arter97-kernel. after installing the files you should restart the device, after turning on the phone re install xmodgames.

Solution 3 (by Emin Orbay)

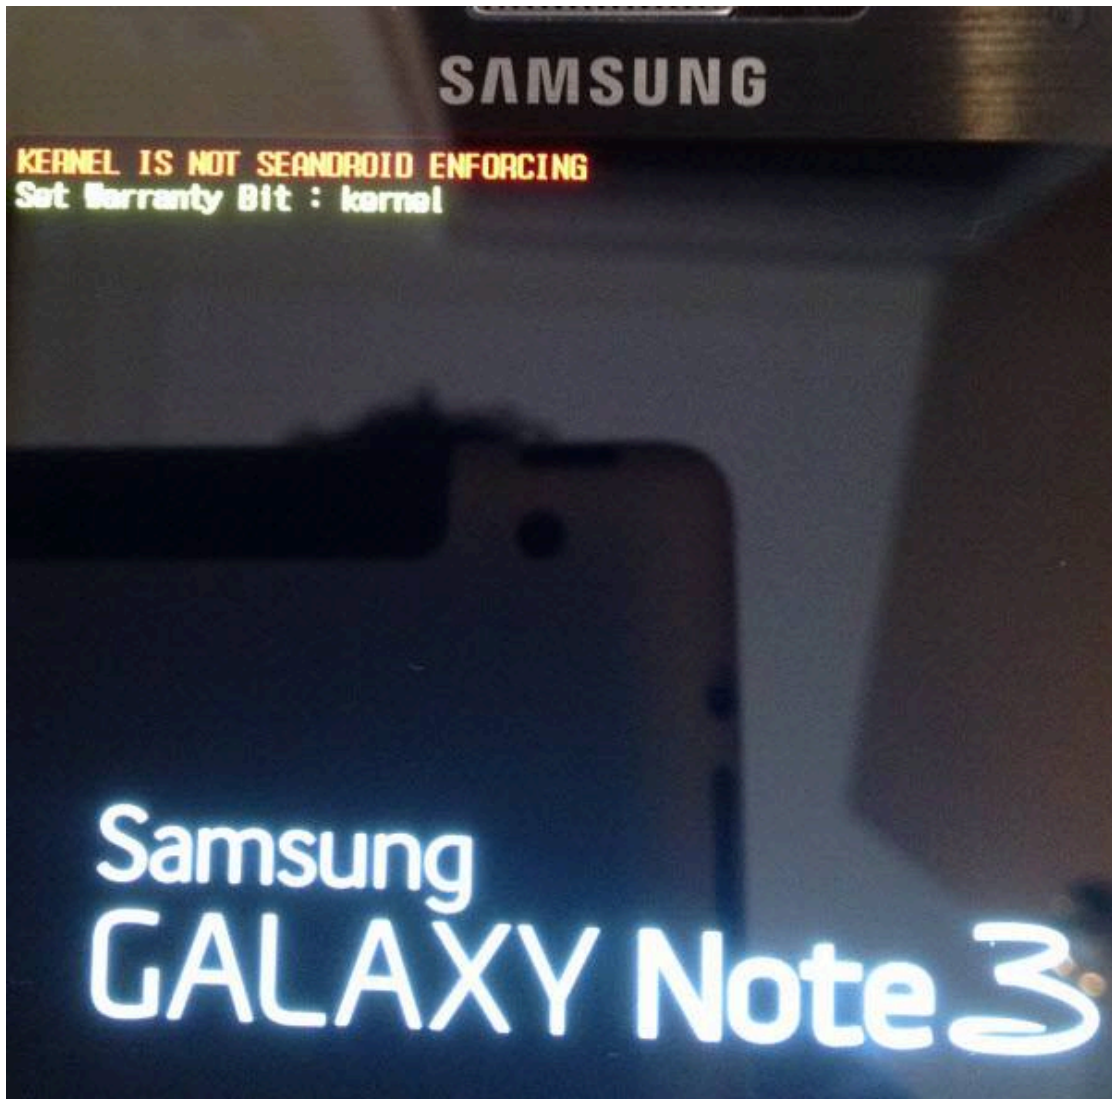

Hello Everyone, Now i will explain you how to make xmod work on official samsung touchwiz lollipop 5.0. I have samsung galaxy note 3 N9005 model with touchwiz lollipop 5.0. This method is works for me. Hope i can help you.

First we have to remove mods from xmod. After remove mods remove xmod from phone also. Later we have to permissive SE for Android Status. Its now Enforcing.

Now only way is custom kernel. Here link for Note 3 lollipop. For other samsung models you have to find yourself. Here link for note 3

http://www.mediafire.com/download/aod6n85a198o4he/lk_hlte-v6.0.zip

Download it and flash via CWM or TWRP. After Flash done wipe caches. And reboot phone. After reboot you should see red text on boot. Like on photo.

After phone open check settings / about device now it should look permissive like on photo. If you still don't see permissive try downloading SELinux Mode Changer from the Play Store. After you get permissive text, you can install xmod and mods. **And boom it's working.**

Solution 4 (by Rizki Mubarak)

Change enforcing to permissive on i9500.

Install

https://basketbuild.com/dlgate/devs?dev=AL_IRAQI&dl=AL_IRAQI%2FS4+I9500+Kernels%2FPrism-Kernel-0.1-i9500.zip

credit to my friend on kaskus community who helped me, and al-iraqi created this kernel

How to Flash A Custom Kernel On Android

Go to this link to know how to flash kernel. After downloading kernel and putting it in the SD card, follow the steps. Don't forget, only use the kernel

recommend for your phone model. If you use other model kernel. You may brick your phone.
