

600 YEARS TO MARS

by

KI

At the dawn of the 21st century
humans flew a robot

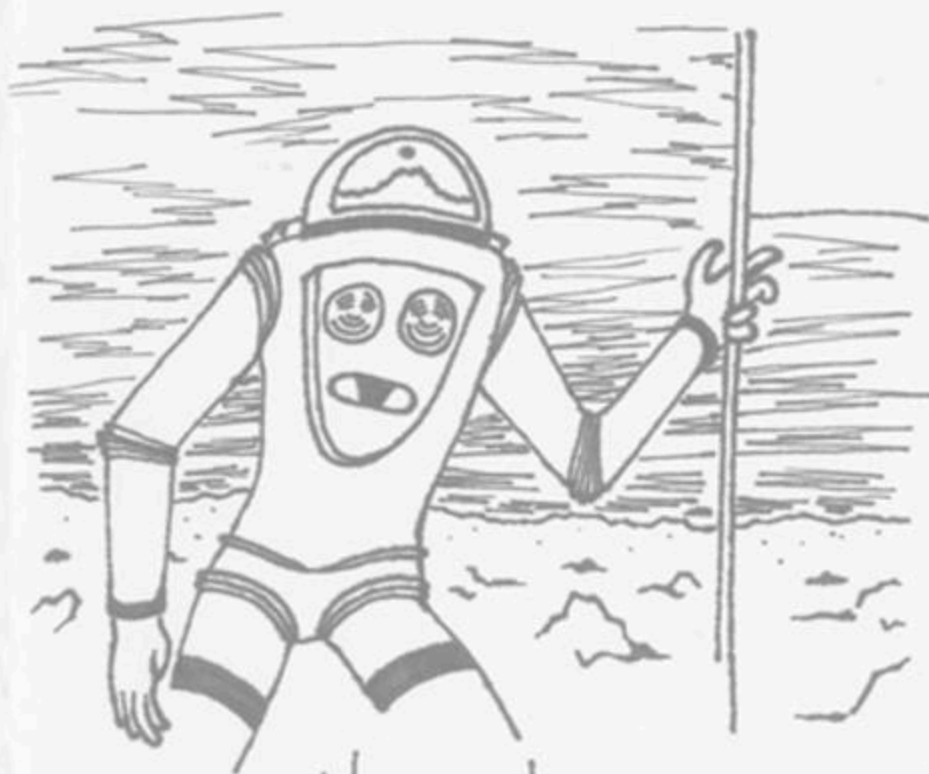

from Earth to Mars.

We publically discussed
colonizing Mars

in the Earth year labeled
2011 A.D.

After decades of preparation
humans touched down on Mars

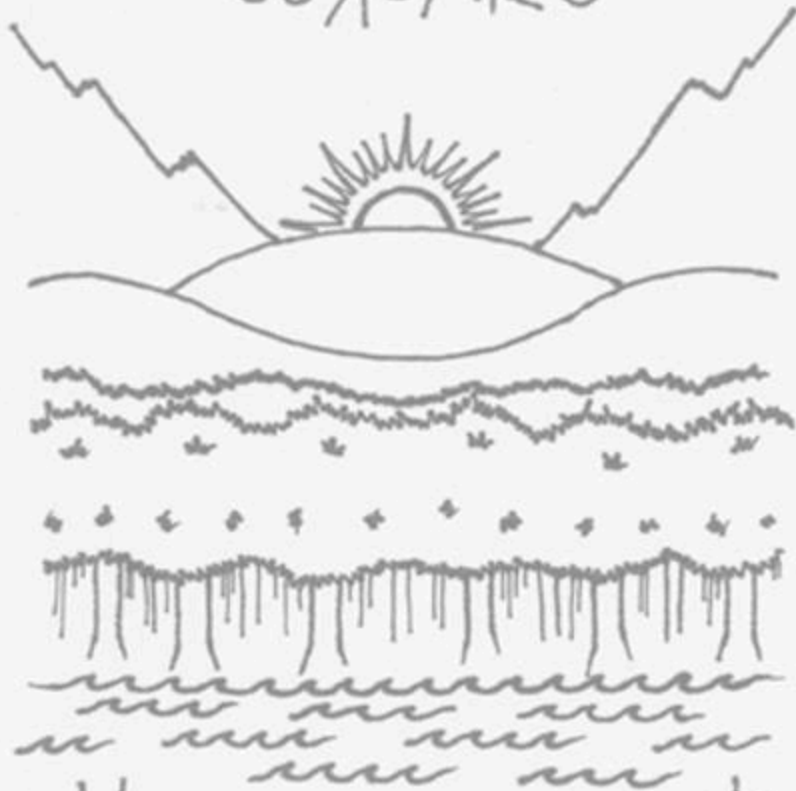

themselves.

We knew then
that to colonize Mars

We could terraform
the biosphere.

Atmospherically
customize

Mars environments.

Mars was 95% carbon in the air
had a weak ozone layer
had a weak magnetosphere

with low gravity
and was high pressure.

We learned how to
terraform Mars

by perfecting Earth's
ecosystems.

In fact
just to survive on Earth
further than their 2100AD.
we had to learn how
to counter act
an accidental terraforming
process already occurring

A
SUSTAINABLE

planet is an

planet.

We knew if we could maintain

Earth

We could terraform
Mars.

We ventured to Mars
in our ships with our bots

and built atmosphere altering
bio-domes on the ground.

It took six Earth centuries to do

but our planet was colonized.
