

Ideas for development

1. include in the calculations not only sums and subtractions but also a multiplicative factor (for example for the volume of the translated text could be a coefficient) in order to score based on quality and scale the vote considering the volume of words translated
2. Possibility to easily edit questionnaire scores, this would allow us to quickly apply changes
3. Possibility to count how many corrections an LM made in the translation, this could be a question in the questionnaire that could increase the vote for the LM and decrease the score for the translator at the same time
4. Possibility to scale the vote for the LM according to the number of words he proofread, even if no mistakes were found since the process of doing the proper proofreading requires time and investigation.
- 5.
