

The areas of application of a bootable USB drive are very numerous, although, without a doubt, its most important function is to start the computer when it cannot start automatically due to a virus attack, a major failure in the system, a broken hard drive or partition problem. Etcher is the perfect solution for this task, as it allows you to create a bootable USB drive that you can use to boot and repair your computer.

But even if a computer is not in danger, it is very useful to have a Windows image ready to protect data on a USB drive (although an external hard drive could also be used). Additionally, a bootable USB created with Etcher Portable can also be used to upgrade Windows 7 or 8 to Windows 10 in case it was not automatically upgraded properly. If the operating system has become very slow due to the accumulated amount of useless data, it can be reinstalled with this USB.

Advantages Of Using Etcher To Create A Bootable USB

Some computer experts and IT professionals also use this bootable USB as a portable operating system. Thanks to it, the operating system itself can be used on another computer without having to install it: the user can use their favorite version of Windows, use their favorite tools, and access personal files on other computers, even if they have another operating system (it does not matter which one), which provides more convenience and security. On the one hand, the user does not have to be constantly accessing the cloud to use the most important files, but rather works in their usual work environment and, on the other, the files themselves are protected in case the computer on which they are you are working, have a keylogger to save passwords or are infected with viruses. This is only possible because of Etcher Portable.
