

# About Viable Community

**This project is currently under development and is being shared via Google Docs as a temporary reference. Once the product is launched, a fully designed and functional page showcasing the outcomes will be available.**

**Viable Community** exists to solve a double-sided systems problem:

- Environmental degradation (climate change, soil depletion, biodiversity loss)
- Human disempowerment (lack of access to tools, knowledge, and governance in sustainability)

The organization recognizes that centralized solutions are too slow or inaccessible. Instead, it creates bottom-up, community-driven infrastructures to take real action — locally and globally. It's not just activism, it's system building.

**Viable Community serves:**

- Volunteers and changemakers looking for ways to contribute meaningfully.
- Communities affected by environmental degradation.
- Funders and partners wanting impact without bureaucracy.
- People who want to live sustainably but don't know where to start.
- Tech-savvy or Web3-interested users interested in governance and alt-finance
- Educators, students, and researchers in sustainability or decentralized governance.

**Viable in numbers:**

- 65 volunteers across the world;
- 13 projects involving nature preservation;
- 11 alliances with like-minded organizations;

## The problem

# The problem

## THE USER PROBLEMS

- No clear way to take meaningful, local action against ecological collapse.
- Frustration with extractive systems: finance, energy, food, governance.
- Lack of transparency and trust in institutions—people want alternatives.
- Sustainability is confusing, expensive, or inaccessible.
- Volunteers feel disconnected or underutilized in many impact organizations.

## HOW IS IT IMPACTING THEIR LIVES

Right now, people feel overwhelmed, helpless, or cynical. Existing systems don't offer clear, tangible, or community-based routes to take action. Even within the sustainability movement, many efforts are too corporate, academic, or superficial.

The lack of structure and continuity makes it hard for volunteers to grow or feel ownership. Without defined roles, feedback loops, or visibility into impact, contributors feel their time is wasted.

## HOW VIABLE HELPS

Viable Community solves this by creating:

- A system, not a one-off project. It builds infrastructure for action: education, marketplaces, governance, and tools.
- A space for co-creation. Projects like AgriPV, workshops, and the Marketplace let people collaborate instead of just donating.
- Transparency & trust. Open source governance, clear documentation, and token-based systems give users agency.
- Accessible tools. Web3 without the hype. Learning and applying sustainability through hands-on, real-world applications.
- Community ownership. Volunteers help shape decisions and own part of the ecosystem.

# Marketplace Problem Statement

# Problem Statement – Marketplace

## CONTEXT

The Viable Community aims to build a regenerative, sustainable future by enabling community-led initiatives that protect and restore nature. While public interest in sustainability is growing, individuals still face barriers to acting on their values in day-to-day consumption.

## THE PROBLEM

There is currently no accessible, transparent, and trust-based digital space that empowers individuals to buy, sell, or exchange sustainable goods and services in a way that directly supports real environmental impact and regenerative projects.

## USER NEEDS

- People want to make conscious consumption choices but lack clear, verifiable platforms that reflect their ecological values.
- Sellers of eco-friendly products and services need a decentralized, low-barrier way to reach a like-minded audience.
- Both need a system that ensures transparency, trust, and value exchange aligned with sustainability goals.

## WHY IT MATTERS

Without a system that connects consumption directly to environmental action, people feel disempowered, and impactful grassroots initiatives remain underfunded. Traditional marketplaces are extractive; we need one that is regenerative.

## POTENTIAL SOLUTIONS

Create a Web3-based community marketplace integrated with smart wallets and VIA tokens to:

- Facilitate transparent, sustainable transactions.
- Support nature-positive projects via transaction fees and token value.
- Allow individuals to contribute, learn, and grow through participation in a values-driven economy.

## IMPACT GOALS

- Foster a circular economy rooted in regeneration, not just sustainability.
- Drive measurable funding and engagement toward environmental and community

initiatives.

- Enable individuals to act as changemakers through every transaction.

# Bussines Requirements

# Business Requirements – Marketplace

## Business Requirements Overview

The Viable Community Marketplace is a sustainable commerce platform where users exchange eco-friendly products and services using VIA tokens. The product's business requirements were defined prior to my involvement by the Product Owner, focusing on a mission-driven MVP that enables community participation, regenerative impact, and financial transparency. Key functional goals included seamless access via social login, smart wallet integration, token-based transactions, clear sustainability labels, and a buyer-seller toggle system, all designed to support Viable's broader vision of environmental restoration through decentralized, community-led action.

## My Role in the Requirements Phase

As UX Designer for the Viable Community Marketplace, I collaborated closely with the Product Owner, who had previously defined the MVP to **translate business goals into user-centered design solutions**. I reviewed the BRD and strategic documents to extract key business requirements and ensure design decisions aligned with:

- Viable's environmental mission
- Token-based payment flows
- Smart wallet integration
- Accessibility and trust in the buying/selling process

My role involved **identifying user flows, prioritizing MVP features from a UX perspective**, and preparing the foundation for usability testing and future iterations. I helped bridge the gap between a product vision centered on sustainability and a seamless, engaging user experience.

# Personas Research

# User Research

## Revisiting User Personas

### Findings

- Users couldn't explain Viable's purpose (62.5% unclear mission perception)
- Dense menu, weak CTA clarity, low visual hierarchy
- Volunteers lacked entry points into action

**Sources:** Brand Survey, SWOT Heuristics, UX Feedback, and User interviews.

### Insights

- Mission not understood → Story must be told in 10 seconds
- Actions unclear → Redesign CTA system
- Structure overwhelms → Flatten nav, prioritize scannability

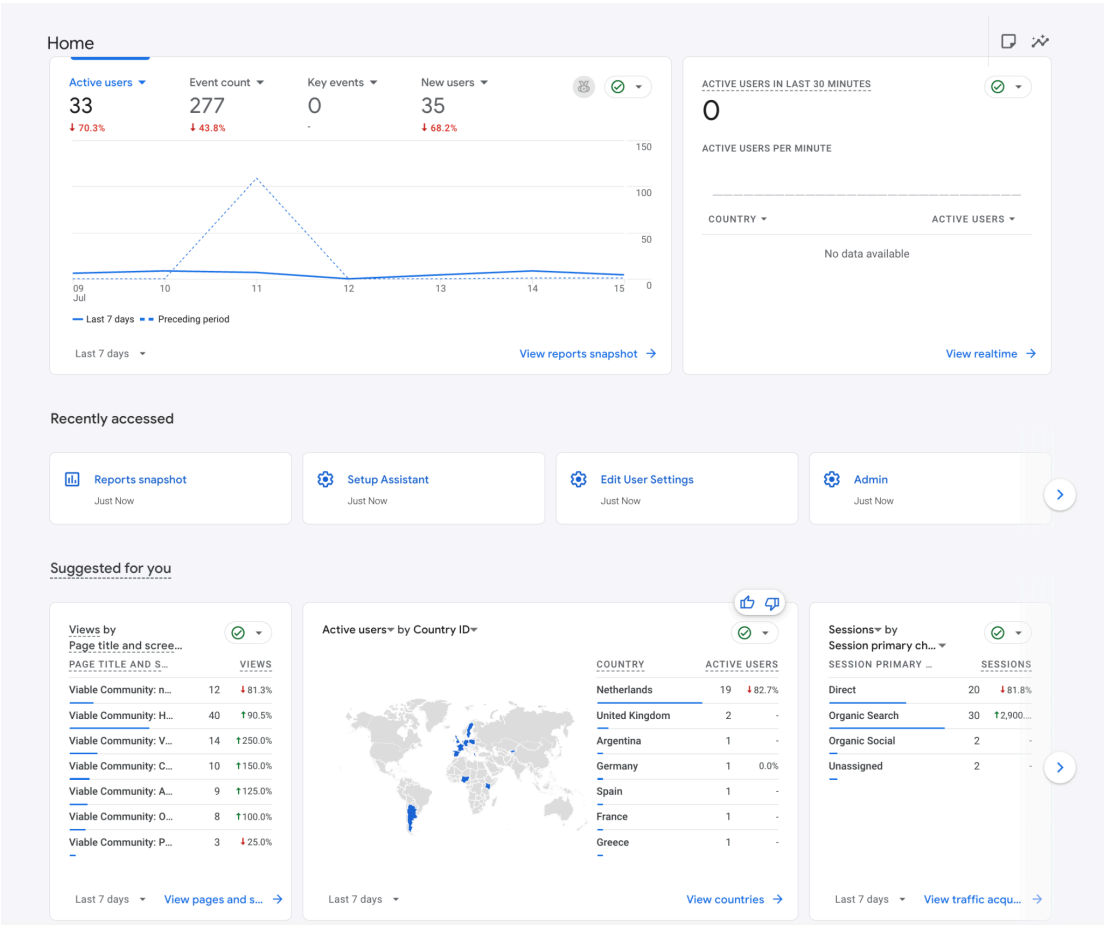

**Sources:** Brand survey, ToC input, Heuristics, and User interviews.

# Competitor Analysis

# Competitive Benchmarking

## SWOT - Website

Organization	Strengths	Weaknesses	Opportunities	Threats
<b>Ashoka</b>	Clean, modern design Strong storytelling Clear navigation structure	Dense menus Weak CTA clarity for new users	Improve user onboarding and visual hierarchy for calls to action	Risk of alienating casual users with jargon or deep navigational structures
<b>Milieudefensie</b>	Activist energy Direct CTAs Local relevance and campaign urgency	Cluttered UI Poor visual balance Accessibility gaps (e.g., contrast)	Redesign homepage for clarity Add multilingual support Use visuals to guide action	Fatigue from aggressive messaging could discourage long-term engagement
<b>The Nature Conservancy</b>	Strong emotional storytelling Excellent mobile experience Engaging content segmentation	Donation flows dominate over educational UX Some global content lacks localization clarity	Use dynamic maps and visuals to enhance environmental transparency	A highly polished design may feel corporate and less grassroots to some environmental audiences

Elaborated based on: Usability heuristics, Visual design principles, Navigation patterns, Accessibility guidelines, User behavior patterns, Fogg Behavior Model, Jakob's Law, and Cognitive Load.

## SWOT - Marketplace

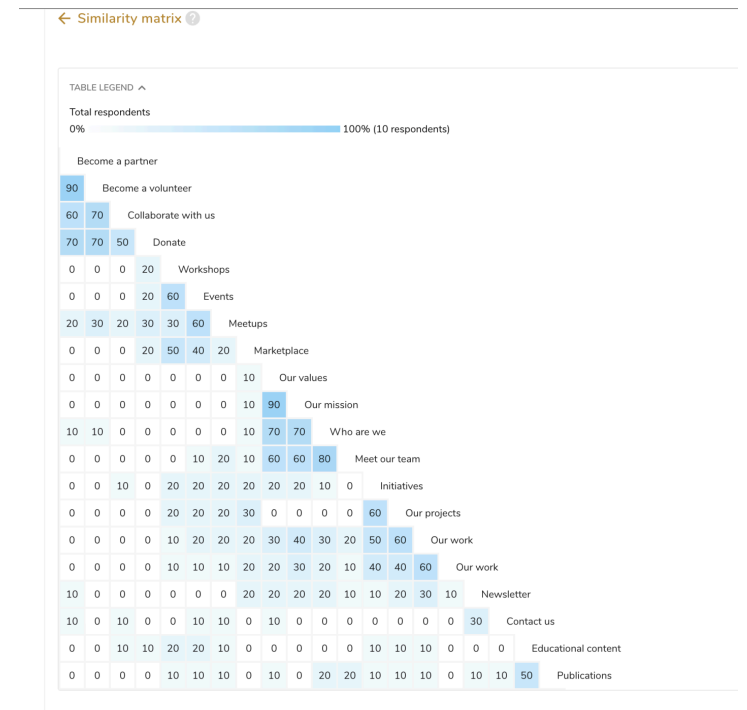

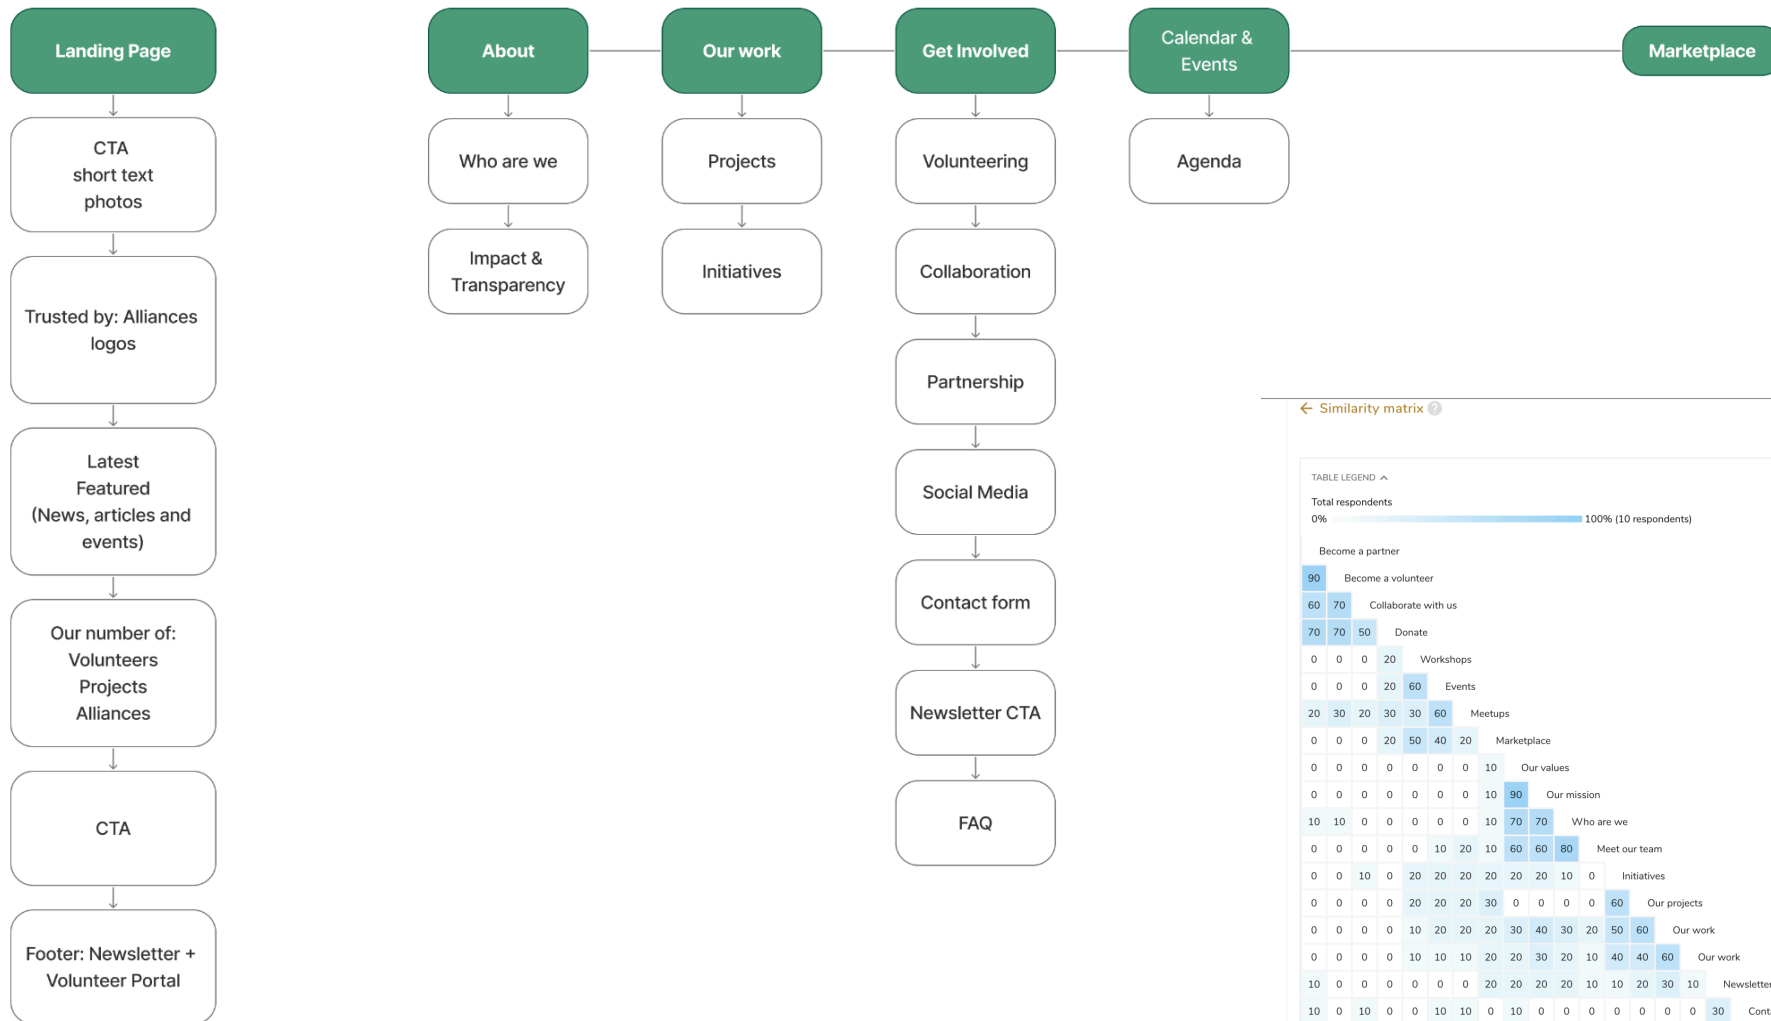

Organization	Strengths	Weaknesses	Opportunities	Threats
<b>Wallapop</b> Peer-to-peer local marketplace for used items - <a href="https://uk.wallapop.com/wall">https://uk.wallapop.com/wall</a>	Excellent mobile-first UX Large user base Strong geolocation features	No sustainability labels Lacks environmental transparency No tokenization or Web3	Add ecological impact per product Introduce a circular economy token layer	Established players expanding in green resale (e.g., Vinted, Back Market)
<b>Green Goose</b> Eco-gift boxes and sustainable corporate gifts - <a href="https://green-goose.be/">https://green-goose.be/</a>	Strong brand & visual storytelling Eco-conscious product curation Corporate gift focus	Not a marketplace Limited product interaction No community or token features	Scale into peer-to-peer gifting Add a token-based reward system	Zero-waste lifestyle brands are growing fast (e.g., Package Free Shop)
<b>Earthy</b> Community-led land ownership and restoration - <a href="https://earthy-landing-66a2f7d6e967e70cca1b071d.webflow.io/">https://earthy-landing-66a2f7d6e967e70cca1b071d.webflow.io/</a>	Powerful regenerative narrative DAO-oriented mission Clear co-ownership messaging	Lacks shopping/e-commerce functionality Weak onboarding Few actionable CTAs	Blend storytelling with token-based trade Partner with green land projects	DAO concepts may confuse non-crypto users • Tech sustainability barriers
<b>Carbify</b> Carbon offset via NFTs and real-world tree planting - <a href="https://carbify.io/">https://carbify.io/</a>	NFT-based CO <sub>2</sub> tracking Strong gamification layer Real-world carbon	Overly technical UX Complex navigation Limited onboarding for non-crypto users	Simplify UX for mass adoption Add a physical product layer	Web3 regulation uncertainty Competition from more user-friendly eco apps

	offset integration
