Families are Invited to the Cognition in Children with Epilepsy Study

A study with researchers from Imperial College London and Cognitron is looking to see if assessing development and cognition in children with epilepsy is possible through an online questionnaire.

As you know epilepsy can greatly affect quality of life. Children with epilepsy often have difficulties with cognition and development, which can range from mild to very severe. Assessing development can be difficult and time-consuming and we want to know if a simple set of tasks done online may be helpful in assessing cognition.

This study aims to assess the feasibility of using an online platform, Cognitron, to assess cognitive function in children with epilepsy. Participants in this study must be aged 5-20 and be diagnosed with epilepsy. Cognition will be measured using a series of tests, similar to those used in the Great British Intelligence Test, but have been adapted to children of different ages.
