

C-Div jig; 2-panel slot-cut, sitting on base plate. Material is 3/16" (which is actually 0.177" thick) cast acrylic, laser cut; base meets 29cm circle bonus; total height = 60.2cm; height at angle break is 19.8cm

View of the two panels jig just slipped together without glueing, and not glued to the base plate. You'll see that at the top, the two ends of the panel slot-cut from the top are not yet precisely aligned on the center of the other panel that's not slot-cut at the top. Leg holding strip pieces have not yet been glued along the outside edges of the jig plates.
