

Adaptation of Plugin Manager by TabSel for use with Magix Music Maker.

25th March 2017

- 1/. Go to; <https://www.dropbox.com/s/mm3iihdle2wxaia/PluginManager%20adaptation.zip?dl=0>
- 2/. Download PluginManager adaptation.zip and extract.
- 3/. Go to **pluginmanager/configs/default/cache/** and double click on VSTScanPaths.ini
- 4/. Enter the path of the folders where your vst plugins are located.
For example, my two main folders are in:
C:\Program Files (x86)\VstPlugins and G:\AAAVST Plugins so it would appear as;

C:\Program Files (x86)\VstPlugins
G:\AAAVST Plugins

and I can also add any other folders that I use like the following;
C:\VstPlugins
C:\Program Files (x86)\Steinberg\Vstplugins
- 5/. Click on File and Save, then close VSTScanPaths.ini.
- 6/. Now go back to the main Pluginmanager folder and double click on PluginManager.bat.
- 7/. Allow it to do its thing and then close.
I ignore the rest of the set up and just close any other parts that I don't need.
- 8/. Finally, Drag the PluginManager Folder to;
C:\ProgramData\MAGIX\Music Maker\25\MxSynth
- 9/. Whenever you add any plugins, you'll have to repeat step 6 to update PluginManager.
- 10/. Launch Magix Music Maker Free and that will then scan for the plugins.
I would recommend that you move the MMM launch panel to one side of the screen so that you can OK any error messages that you might get.

NOTE 1: it may take a minute or so before you can move the MMM launch panel.

NOTE 2: If Magix Music Maker crashes just close it with Task Manager and relaunch it.

- 11/. Once Magix Music Maker loads, it's ready to use.

Here is the link to the original PluginManager, if you would like to explore it further.

Many thanks to TabSel for this useful utility which was a great help in FLStudio to v11 and now for MMM Free.
