

Find Best Option for Your Shower Repair

Everyone has to face the issue of a leaking shower head one day or another. Here are 6 tips to help you recognize the issue and fix it yourself. Homeowners should be aware that most shower head leaking can be repaired without the help of a plumber provided the right tools are available. This includes a wrench, a screwdriver and a rubber washer. It is often difficult to determine the exact cause of the circulation by simply looking at the shower head. These include of a variety of elements operating in balance to allow water

circulation easily. Before repairing a leaking shower head, remove all screws, focusing on any parts that may be reduce or damaged. All shower heads are prepared with a rubber washer that plays a part in controlling the circulation of water. However, not being a lasting material, the rubber is subject to wear. Most rubber washers have a life of 7 to 10 years. Water can begin circulation when damaged.

The only way to say the rubber washer is no longer operating is to start the shower head and examine the structure. If the rubber washer is used, it must be changed. Rubber washers are cost-effective and quite readily available in most hardware stores. Placing a rubber washer does not need prior assessment with a plumber and can be easily done by a person, as long as this person knows how to start the shower head. If the rubber washer is unchanged and efficient, the next step will be to check if the issue is not caused by the internal water supply valves. These valves lead to controlling the circulation of water in the shower head. Sometimes they can loosen or rust. It must be assured that they are not damaged. In some cases, the circulation may be due to the buildup of mineral salt and other waste in the shower head. To remove minerals and waste, it must be separated and taken apart.
