The founder of a wellness startup in stealth mode, which is on a mission to eradicate the obesity epidemic and reduce the insane sugar consumption in the U.S., is looking for a visionary data scientist to join as a co-founder.

Ideally, you are nutrition- and health-conscious person, aghast at the way Americans consume unhealthy food, have at least 10 years of experience in data science at either an e-commerce, food or retail company, familiar with fuzzy logic, deployed services and apps on the cloud, and have an advanced degree in mathematics, statistics or a similar field.

You will lead the development of proprietary machine learning, optimization algorithms, natural language processing, and elastic search, and build a scalable and modern database with as many as half a billion (that's billion with a B) data points. Moreover, you will help bootstrap the company, develop a POC and raise capital to take it to the next level.

As the co-founder, you will receive substantial equity in the company, rather than hired as a regular employee on the payroll. I know your hands are full with your full-time job (just like the founder's hands are), but this is a revolutionary idea for a true visionary individual who dreams about making a big-time social impact. If you think you are the one, email me at cofounders@icloud.com.
