Specification for facet behavior when a field is not coded in the MARC record ([D-1301](#))

1. There should be one term to display in a facet that shows the number of items in the catalog that do not have data in the field for the facet (or the user-equivalent of non data)- we'll call this empty data. This term should be definable by the library (or Pika instance), but should be consistent across facets.

2. The library should be able to define which facets display empty data and which don't.

Technical notes from Mark:
-Need to check performance on whether it's faster to add the default value or facet.missing
-For the word configuration, whether this is per library or per install depends on performance issue above
