Preventing Animal Suffering Lock in: Why Economic Transitions Matter

Inputs

Interdisciplinary research structure (economics, policy, systems thinking, animal ethics)

Funding and time

Access to paradigm communities (degrowth, AI economics, resilience)

Academic collaboration opportunities

Network building within EA/longtermist communities

Skills development in systems analysis and institutional design

Assumptions (to test)

Activities

Map animal inclusion gaps across three economic paradigms

Map policy intersection opportunities: identify non-animal policies with major animal implications

Develop animal-inclusive frameworks for each paradigm

Build relationships within paradigm communities

Test frameworks and intersection strategies with key actors and adapt based on feedback

Engage with EA/longtermist research community

Paradigm communities open to moral expansion \rightarrow Early interviews

At least one paradigm gains policy traction → Trend analysis

Academic influence shapes paradigm development → Historical analysis

Non-animal policies can deliver significant animal benefits → Impact modelling

This research has counterfactual impact → No other researchers in this space

Outputs

Research papers in paradigm journals (citations, co-authorships)

Animal-inclusive economic models (adoption by researchers)

Policy intersection database (number of high-leverage policies identified)

Academic collaborations (ongoing partnerships)

Leverage analysis for advocates (adoption by advocacy organisations)

Short-term impact

Paradigm communities recognise animal inclusion gap (survey/interview data)

Key economists integrate animal considerations (content analysis)

Animal advocates engage non-animal policy processes (strategy shifts)

Policymakers recognise co-benefits (policy document references)

Mid-term impact

Animal welfare standard consideration in paradigm development (references, curriculum inclusion)

Paradigm research institutes adopt animal-inclusive frameworks (institutional policy adoption)

Animal advocates routinely engage with transition policy processes (strategy shifts at major organisations)

Policy evaluations include animal co-benefits (government impact assessment frameworks)

Long -term impact

Economic paradigms systematically include animal welfare (policy analysis)

Reduced animal suffering through direct and indirect policy channels (outcome tracking)

Prevent moral catastrophe through value lock-in prevention (civilisational resilience)

Goal

To reduce the scale and intensity of animal suffering by influencing how economic paradigms evolve and by identifying high-leverage policy and advocacy strategies that anticipate systemic shifts

Key actors

Paradigm leaders: E.g., Tim Jackson, Kate Raworth, Erik Brynjolfsson, Rob Hopkins

Policy actors: working on transition policies (e.g., UBI pilot schemes, 4-day week coordinators)

Academic Programs: Alternative economics course leaders

EA/Longtermist: Rethink Priorities/ Sentience Institute researchers

Feedback loops

Quarterly stakeholder check-ins on framework relevance

Annual assumption review based on paradigm evolutio

Policy impact modelling to test intersection opportunities

Adaptive research design responding to findings

Risks and mitigation

Communities reject animal focus → Environmental/co-benefit framing

Academic work doesn't influence practice → Direct policy engagement

Policy intersections smaller than expected \rightarrow Focus on direct inclusion

Research becomes too theoretical \rightarrow Regular stakeholder feedback

Low tractability → Focus on highest-leverage intersections

Advocates struggle to engage with non-animal policy processes → Develop specialised training materials
