Scientific Writing: Linking cause and effect.

In science, you need to be able to connect "cause and effect" in two ways:

- 1. To emphasise the cause- when explaining why something happens.
- 2. To emphasise the effect when describing what happens.

To connect cause and effect we can use connectives as in "the speed of the car was constant <u>because</u> the forces were balanced."; or by using verbs as in "The balanced forces on the car<u>leads</u> to it travelling at a constant speed".

Notice too, the importance of <u>locating the action</u> in both these sentences, without the object the car it is harder to understand what is happening and why.

Using connectives in different positions changes the emphasis.

because	Since	For this reason
So	Consequently	Because of this
as	Therefore	As a result

Emphasising the cau Example. Label the Cause, Effe		nective	
"The ball changed sh	ape as a re	sult of the forces	s applied to it."
Emphasising the effe Example. Label the Cause, Effe		nective	

"Since there was a force applied to the ball it changed shape."

	Complete these sentences The sprinter accelerates	_the resultant
	force was greater in her forward direction.	
2.	The shopping trolley was stationary	the
	resultant force was zero.	
3.	the resultant force being greater	in the

Task 2

Label these "E" if emphasise the effect or "C" if they emphasise the cause.

backward direction the racing car slows down.

- 1. As parachute opened increasing the surface area the parachutist decelerated
- 2. The forces acting on the motorcycle were balanced, consequently it travelled at a constant speed.
- 3. The boat changed direction as the wind blew with a greater force from the east.
- 4. The lamp post buckled because of the unbalanced forces applied to it by the crashing car.
- 5. The friction acted in the opposite direction of movement, for this reason the snooker ball eventually stopped.

Task 3: Rewrite the above sentences to change their emphasis.

Task 4: Practice questions

- 1. Why did the train travel at a constant speed?
- 2. What would happen to the speed of a car with a greater resultant force in its forward direction.
- 3. A book sat on a table is pushed with a force of 50 N to the right. Its frictional force acting in the opposite direction is 30 N. What happens and why?
- 4. A tent peg is hit with a hammer with a force of 100N, the ground pushes back with a force of 100N. What happens and why?
