How to delete installed Apps on Android

With these instructions you can delete pre-installed apps. Okay, in fact the apps are not deleted. It

only removes the apps from the data partition. But they disappear from the Appdrawer and no

longer take up any storage space. They also disappear when the watch is switched off; they are only

restored by a factory reset. Or just a flash of the firmware.

Please note: Even if I think that something cannot really be destroyed on this way: You do this at

your own risk. I am not responsible for any damage.

Step 1

First, download the Minimal ADB and Fastboot software on your PC. Be sure to use the latest version,

otherwise problems may arise.

Step 2

After downloading the .zip file, open the file location. Usually this is the Downloads folder. Now you

have to unzip the file by right-clicking on it and selecting "Extract all ..." from the list.

Step 3

Then select a suitable file storage location. To make it easier for you in the next few steps, select the

C: drive and then click "Extract".

Step 4

Navigate to the folder and install "Minimal ADB Fastboot v1.4.3.exe". Follow the installation steps

and in the last step select "Launch Minimal ADB and Fastboot". Click on "Finish". Before you can

continue, you still need to enable USB debugging on your smartwatch.

Step 5

Now take your smartwatch. You now need to activate the developer settings. To do this, open the

settings, scroll down to "Phone info" and open the "Software information".

Step 6

Now tap on "Build number" several times until the message "Developer mode has been activated" is

displayed.

Step 7

Now look for "Developer Options" in the settings and open it. There you scroll down to "USB

Debugging" and activate the switch. Then connect your smartphone to your PC with a USB cable and

allow access to phone data.

Step 8

Back on the PC, the tool has already opened automatically in the Windows command prompt. You

can use the "adb devices" command to verify that your smartphone is connected to ADB. In that case

you should see a message on your mobile phone that you confirm with "OK". Enter the command

"adb devices" again, the device number should be displayed with the status "device". This means

that the cell phone is connected and ready to use.

Step 9

Now enter the command "adb shell" to enter the interactive shell.

Step 10

If you now enter the command "pm list packages", you will see all installed packages. This includes

not only apps visible on Android, but also system components.

Step 11

Install "Package name viewer" on your watch to figure out the exact name of the Apps that you want

to deinstall.

Step 12

To uninstall an app, enter the command "pm uninstall -k --user 0" followed by the name of the

Application (5 spaces in total with a zero). For example type, pmspaceuninstallspace-kspace--userspace0spacecom.wiitech.WiiWatchPro to uninstall the Asisstant

app.

Step 13

After successfully removing the app you should see the message "Success".

Special Note

For android 8.1 install settings search on watch and reduce font and display from default to small before starting the process above. Also to avoid a " screen timeout increase the watch's display time "
