

I had the Armor.bin error for 2 days and I fixed it on my computer after a lot of editing.
I'll type all the steps I did the last time that made it work for me!

READ FIRST: IF YOU GET ERRORS THAT ARE MENTIONED IN THE !KNOWN IN DISCORD PLEASE DO THOSE STEPS ALSO. IF THEY ARE NOT LISTED THERE JUST RESTART PC AND CONTINUE.

1. Checked my graphic drivers and updated them.
2. Uninstall Diablo II and Diablo II LOD + PD2" Launcher (Make sure you go into regedit and remove diablo 2 from there as well + windows button and search "remove" to get into "add and remove programs). Search for diablo 2 and uninstall. Search for PD2 and uninstall.
3. Check ur Virus protection, firewall and network protection and app & browser control.
 - Click on Virus & threat protection - manage settings - disable all
 - Click on Firewall & network protection - turn off domain network - turn off private network - turn off public network.
 - Click on App & browser control - Turn it off.
4. Now make sure there is no Diablo II or PD2 launcher or old rar files, remove everything you downloaded and do fresh download from <https://www.blizzard.com/en-us/>
5. I downloaded the EU version since I'm in EU but I think US works fine too.
6. Download both and install them where the installation requests. Mine was "C:\Program Files (x86)\Diablo II"
7. Download PD2 launcher at <https://www.projectdiablo2.com/Download>
8. Install PD2 Launcher, make sure to set as admin if it isn't and launch it. **If it works you can quit here if not try this under.**
9. Find your "Diablo II" folder and locate Diablo II.exe and Game.exe <https://prnt.sc/vcs1vi>
10. Change Compatibility mode to Windows 7 and Admin for both and start Diablo II.exe until you get to the login screen and do the same with Game.exe. **Don't panic if it updates diablo.**
11. Now remove Compatibility from Diablo II.exe and Game.exe
12. Start PD2 Launcher again and try, if this still dont work restart your computer and try again.
13. If it still doesn't work after restart go to "downloads" and start the "ProjectD2Installer" and uninstall and install it after.
14. Make sure PD2 Launcher is Admin and try to run it (maybe try a restart if it doesn't work)
15. IF you still have issues you can try to go back to "Downloads" and find "ProjectD2Installer" and click it, repair, and restart + launch again.

If this worked you can turn back the antivirus and firewall :)

This is what I did and it worked. Let me know if it works for you!
