

Omni-Directional Camera *Ladybug 3*

Internal/External Camera Parameters

The topic `/viz/omnicam/image` stored in the ROS bags contains images like this one:

Each row of pixels of the 6-in-1 image is a result of decimation of two original rows. It is necessary to restore the original number by cloning each row of the image.

To obtain images of a single camera, it is necessary to split it into 6 parts and rotate each one. Camera indices start from 0, which relates to the top image (therefore, the bottom one is “camera_5”).

In the following text, we describe internal and external parameters of each camera. The external parameters express transformation from the given camera frame to the common “omnicam” frame - see the Ladybug 3 online documentation for reference. The transformation from this common “omnicam” frame to the robot centre is

omnicam -> base_link

- Translation: [0.014, -0.097, -0.271]
- Rotation: in Quaternion [0.000, 0.000, 0.454, 0.891]

in RPY [0.000, -0.000, 0.942]

IMPORTANT:

In each ROS bag file we provide, there is the “/tf” topic storing all the transformations, including the external parameters of the omnacam frames. Those are not the same as those we publish in this document; we have performed better calibration after recording the bag files, the values below are more precise.

Camera 0
