Hi Mk,

just som few questions for gui :

55_BACKUP (a new category, are you ok?)

for autobackup,
        there are home backup, and system backup.
        is somedays, another backup can/will be added?

for delta backup,
        Is user can configure only one by backup mode (system/home) wich one will be
monthly, weekly,daily
        or he can configure one for monthly, deactivate one for weekly, and activate one for
        daily?

for home backup
        Is user can do it on a block device or only on a file?

40_UPDATE

in aptstatus log:
Failed to fetch
http://ivka57.dyndns-ip.com/pool/main/x/xbian-package-config-shell/xbian-package-config-shell_
2.1.6-24_armhf.deb 404 Not Found
E: Unable to fetch some archives, maybe run apt-get update or try with --fix-missing?

but with change in api,
i just find that i din't check final status install, but how i can do it?
is it xbian-config updates progress that return an error?
For now, i think it's just a switch apt is running.

or is it xbian-config updates installtest that i've to run before and check his status code?

maybe a new api :
xbian-config update status [packages/upgrades] but don't know if needed anymore

and i always return install ok.

That's all for now.
Thanks.
