

Poojan Chaniyara is a biotechnology student exploring the design of human systems in constrained and non-terrestrial environments. His interests lie in how infrastructure, governance, and culture interact in long-duration space settlements. Through his work, he examines challenges such as power concentration, knowledge distribution, and civilizational continuity under isolation. He is currently developing conceptual frameworks to understand how human societies might evolve beyond Earth while maintaining stability and coherence, presenting early-stage ideas that connect technical systems with broader questions of policy and civilization.
