

Setting Up Your Dev Environment

1. Download and install VirtualBox. If you already have it installed, make sure it is the latest version.
2. Download and install Vagrant. <https://www.vagrantup.com/>
3. Follow the instructions at <http://jeremykendall.net/2014/07/28/from-zero-to-slim-framework-getting-your-first-project-off-the-ground/> to install:
 - a. Apache, a web server (when given the option to install or set up Apache vs. Nginx, choose Apache.
 - b. Php, a scripting language
 - c. MySQL, a relational database engine

For step 3, you don't have to use the sitename "zero-to-slim.dev"; you can substitute something that you prefer. Just make sure you consistently substitute throughout the set up.
