

Presentation – Chemistry in Our Daily Lives

It is no secret, chemistry is all around you. From the clothes that you wear to the glass that you drank your milk out of this morning. In this assignment, your purpose is to show what you know about how prevalent chemistry is in your life. You can look at a very specific topic such as the chemistry behind a concrete driveway or stay very broad and just document how many things you come in contact with starting when you wake up and finishing when you go to sleep.

There are no guidelines for this presentation. Your only task is to present your ideas in a form that works best for you. Some ideas may include:

- video
- poster
- song
- game
- PowerPoint (must be presented to the class)
- research paper
- sculpture
- dance
- other?

There are hundreds of examples that would be acceptable on the internet. Feel free to use any of the ideas but be sure to reference the idea and turn it into something that you are proud of. Three items that you may want to consider are:

1. How society has transformed matter to understand and control nature
2. Creating new products and processes to benefit society
3. Any cultural perspectives that might be interesting
