

Security Services In The World

The events that impressed the world public opinion, like the ones from New York, Madrid or London, determined the specialists in personal security services to start a deep program of redefining the security services in the world. It is becoming more and more obvious that security turns out to be the pawn at the base of the economic development and the population welfare. The security administration begins with the individual and supposes new approaches and concepts. If during wars, the security was the military domain, these days it became an industry, with self procedures and quality standards.

The studies prove that by the 9-11 events in the United States, the security wasn't a priority for its management, as the responsibility was very low. The security manager wasn't directly subordinate to the general director, therefore the communication between the state's agencies was extremely low. The new reality and the perspectives of the political and economic mutations command an urgent redefinition of security.

The new attitude of the international security refers to dynamism and complexity. The last trend in security services in the world implicate a network war, as a consequence to the digital Net-To-Net approaches. Just like in football, if the speed of the ball has to increase, the speed of information becomes vital for the new century and for the new management type of security.

The security of a nation becomes a problem of the public-private cooperation, when authorities and the state's institutions administrate a family of risks and threatenings. On the other side, the private security companies become responsible for a lot of other vulnerabilities, specific to the private domain of the state or the individual. Both the specialized authorities and the private security companies are connected and contribute to creating a national environment of security that brings forward to economic development.

Security becomes a products. It generates the apparition of new terms, like price or quality standards. These days, the governments look for some ISO standards both for the private security services. The whole idea is to get to the same quality for similar services in New York, Moscow, London or Tokyo. For this reason, Global Partnership For Security Standards (GPSS) comes with a new approach of security, from the perspective of both the individual and the crowd.

If terrorist threatenings hold the first position in the national security strategies, it is obvious that the public security must be managed in a different non-traditional way. These new approaches carry the revaluation of the prevention activity, therefore the actions of gathering information and maintaining a professional alert and surveillance condition become primary.

A good example can be the surveillance cameras, which manage to solve many violent cases of attacks. This is why the state has to cooperate more and more with the private security companies. Getting this industry as transparent as possible will increase the people's trust in such services. Security services in the world must become the main specialized partner of each state, highly qualified and ready to manage the personal security services of a nation.
