CABAL does not require account registration.

Messages are end-to-end encrypted on your device (AES-256-GCM) with a key derived from the channel key. The channel key itself is never sent to our servers, so neither we nor our hosting provider can read your messages.

Only one message exists in a channel at a time. It is deleted from the server 20 seconds after it is sent, or as soon as the other side starts typing a reply, provided that at least one participant is still in the channel. Otherwise it stays on the server in encrypted form only, until the channel is deleted.

Channels expire one hour after the last activity and are then deleted.

The service runs on Google Firebase (Cloud Firestore), which acts as our data processor. Like any internet service, it processes technical data such as IP addresses in order to deliver the service. We do not use analytics or advertising trackers and we do not sell user data.

Anyone who knows a channel key can join that channel (up to two people at a time), so share keys only with people you trust.

No system can guarantee absolute security.
