Edit your reels in Final Cut Pro

Export from Reduct

From the reel export menu, select **Final Cut Pro X (xml 1.8 & srt)**.

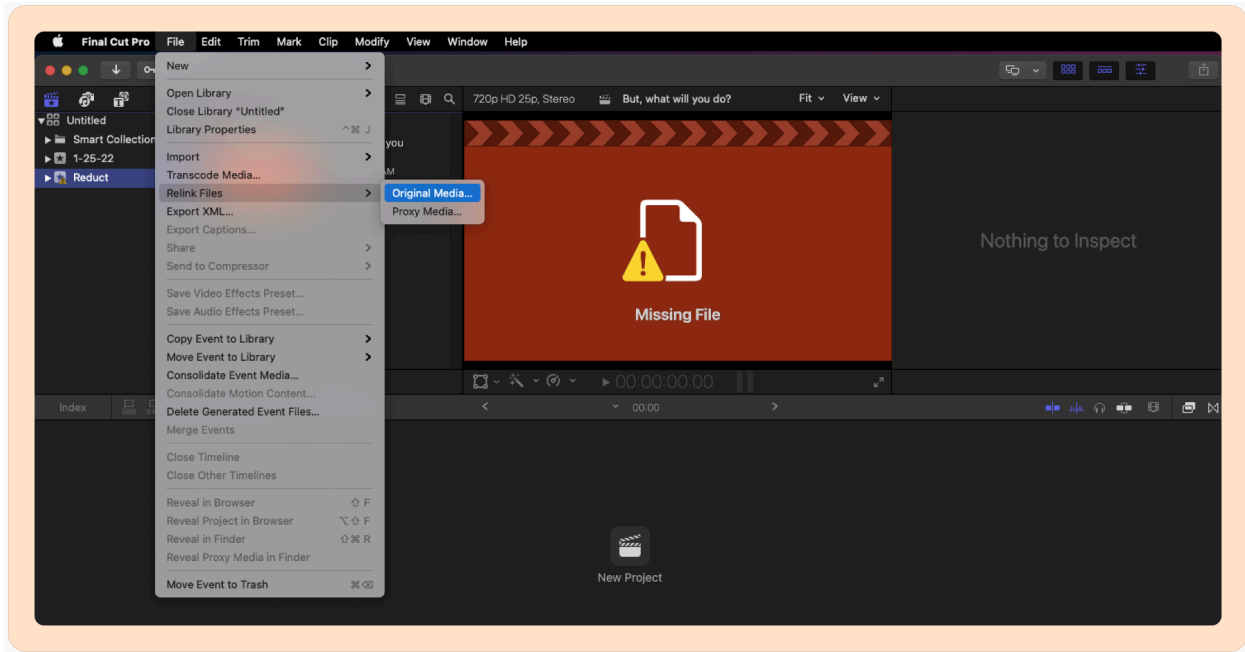

Import into FCP

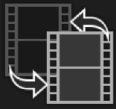

Open the **.fcpxml** file that you just downloaded. If you have Final Cut Pro installed, the file will automatically open within FCP.

Table type	Callout
Title	 Pro tip:
Description	If you get a warning about edit frame boundaries, just hit OK .
Color	Red

You can now re-link to the original file in FCP. Under **File**, find **Relink Files >** and select **Original Media**.

In the popup window that appears, find the source file on your hard drive, and click **Relink Files**:

Relink Clips to Original Media Files

Relinking clips replaces the original media and updates all instances of the clips in the library "Untitled." To replace the media, locate files on your storage device and click Relink Files. You cannot undo this command.

Relink Files

Edit

You now have a Final Cut timeline where your reel (+ captions!) have been imported, so you can fine-tune your reels using the tools Final Cut provides you.

Limitations

Note that the XML export does not include any title slides that might be in your reel.
