

Since I can remember, I have loved computer science. I have always had a computer or playstation in my room, and I have spent countless hours using them. My interest started when I wrote a simple chess game on my computer using Python. Gaming also played a core part in my love for computer science. I have looked at source code for countless hours attempting to better my skills in C#, because my favourite game - Apex legends is programmed in this language.

In addition to this, I have also watched tutorials on youtube on things such as for loops, while loops, and if statements. I am shocked by how versatile they are, and how you can do almost anything with these functions. In all my school projects, I was able to complete all objectives stated by using these functions.

For maths, I participated in the UKMT challenge, and got a bronze certificate. I had to really push my maths skills and do a lot of preparation beforehand, and my hard work paid off as I was able to nab a certificate. For year 13, I will also participate in the UKMT, but I will prepare even more because I want to challenge myself to get an even better certificate. Unfortunately my girlfriend got a gold certificate so I really need to stretch myself.

In gaming I like to play car simulators and plane simulators, which help me get a really good idea of how physics works in real life. I believe that this will help me greatly because I will be able to visualise mechanics taught both in A level maths and in university which will help me understand concepts better and learn faster.

I am very dedicated to studying and I like going to the coffee shop to sip tea and study material to prepare myself for applying to Oxford or Cambridge. I enjoy reading classics such as Sherlock Holmes, and The Hounds of Baskervilles. These greatly help me improve my writing and my grasp on the English language so that I can write witty jokes and phrases.

In life I am learning to ride a bicycle because it is good for the environment and will help me to travel faster if needed. I heard that there is a housing crisis for accommodation and riding a bicycle will allow me to live further if needed, so I will be able to attend university anyway. I greatly believe in preserving the environment as the effects are plainly visible to all. For example the heatwaves across Europe, and harsher winters and floods.

I also like playing basketball as I get to build my social skills and improve my teamwork skills because it is a team game. I also get to stay fit and get noticed by everyone. I am also very smart so I play chess regularly. I am 1000 MMR and part of my schools chess club. I was chosen to participate in a chess tournament in my previous school which I am very proud of. Finally I like to socialise and I am very good at communication and learning and listening from other people. I have many friends and most of my hobbies have a social element, including debating. I participated in a debate against a rival school about the ethics of capital punishment, and won easily because I researched a lot and made very intelligent points.
