

a An increasing population

If all the organisms in the younger age groups grow up and reproduce, the population will increase.

b A stable population

The sizes of the younger age groups are only a little larger than the older ones, so this population should not change much in size.

1. What type of information can you

get from the population pyramid?

birth rate and mortality, "babybooms", average dying age and parable of female and male amounts.

2. Describe the two pyramids in the picture

The A pyramid is an increasing population pyramid meaning that the population increases due to the fact that there are more people born than more people dying.

The B pyramid is a stable population pyramid meaning that the population stays the same due to the fact that there are as many people born as people dying.
