Angshu
Suman
Bindu
Krishnan
Pramida
Shilpa

Notes

1. Release 0.91 QA update
   - Shilpa: Most of the cards do not have steps/descriptions - for features, issues - steps to reproduce.
     - Dimitri: we have to urge people to put more structured cards - acceptance criteria, description, context.
     - Suggestions:
       - Shilpa: Devs to check the necessary information present in the card.
       - In future, we may not do a PR merge, or feature dev unless the card has necessary details
   - We should figure out the cards which are not having enough details, and urge the person(s) who created the cards to put more details.
     - Pramida/Bindu to have a look tomorrow and ask teammates to update any relevant card

2. Radiology sync issue on demo
   - pacs integration sends the order (HL7 msg) to PACS confirmed to MW (modality worklist) item.
   - On demo: without an actual modality, a simulator does that. But it replaces the PACS part (Dcm4Chee) - uploads a 'hard coded' image to Dcm4chee. PACS integrator sends to simulator, which uses a Dcm4Chee to upload the image directly. As a result on all these, the orders are not created in PACS at all. This is not a good user experience.
   - demo-us has Dcm4Chee instead of Simulator.
   - Suggestions: allow ability to upload the image. Possibly extend the radiology upload to post (using the Dcm4chee API) the DICOM image to the Dcm4Chee.
     - Create a feature card. Estimated to be 1 week. Already a [trello card](#)
3. Registration page: exit from the page, confirmation popup
   - even after save, the popup is shown. - this is fixed by Krishnan in another PR to be merged. This is driven by config (default should be false, if not present in config, in code default would be false).
4. Patient relationship search

- Relationship search: Suman to update the PR for common code for checking duplication for all relationship type. We will look into the details and take a call for introduction in the release or not.
5. I18n
6. OpenMRS Attachments module could be use in regards to the above 'radiology sync issue on demo':
   a. Dimitri: A GSOC project OWA in progress
   b. [Openmrs Attachments module](#) can be leveraged as well
