Blue Ocean Solids
Data & Research Intern

Looking for the excitement of working for an innovative start up? Water plays a key role in the cooling and heating of a commercial building, facility, or industrial process. However, the importance of water treatment is not stressed enough. Blue Ocean Solids is a company that provides an alternative solution in water treatment. They are committed to a safer work environment and lessening the effects of climate change.

The Data & Research Intern will assist the company through research and data mining of known sources as well as those you will find. As a Cincinnati 2030 partner, the company wants to reach 2030 members through a convenient database compiled by the intern. Information about members' sustainability goals is already available, and you will play a crucial role in customer attainment by helping to compile data and summarize company goals to make it accessible for our outreach efforts. There will be sufficient training to allow you to hit the ground running.

No experience necessary. *Interest in sustainability, marketing, chemical engineering or data analysis is a plus. It is not expected that one student will be interested in all of these.*

Hours: Spring, 5 hours per week for six weeks with option to extend
Summer, 8-10 hours per week for 3-4 weeks. We will work out your vacation & known planned conflicts, there is flexibility.

Students MUST apply through the Experienceships program.
