

What's Up With `//base`

With special guest Peter

`//base` is a low level directory that's referenced all over the code base. What's in it? What should you be using? How is it related to the C++ standard library? Today's special guest is Peter. He's a style guide driver, has worked on updating C++ versions, is our newest base owner, and has been on the team since the beginning.
