

Decision Grid:

Action: Build a nuclear power plant		your decision?
Plan A: Yes		Plan B: No
Nuke Accident false	nobody is hurt, worth the build saved energy/resources	Still using coal resources could have saved energy
Nuke Accident True	many people injured money wasted	saved lives didn't waste money

- If a nuclear power plant was built and an accident did not occur, I decided that nobody would be hurt, it would potentially be worth the build and allowed us to save on energy and resources. With an accident not occurring, there would potentially be no risks involved.
- If a nuclear power plant was built and an accident did occur, I decided that many lives could be lost and there would be a lot of money wasted. With everyone getting hurt, the money that the plant owes may exceed the cost that it took to build.
- If a nuclear plant was not build and an accident was not going to occur, there is still a reliance on other forms of energy that may not be clean. There would also be money being wasted, because there was potentially no risk to building the power plant
- If a nuclear plant was not built and an accident was not going to occur, there would be many lives saved and the money being used to build and run the plant would have been wasted if the plant was built
