PAR Assignment

- a) How can I differentiate the explanation of my cooperating teacher when working with students independently?
- b) This question is important to me because I work with 5th grade students. In math class, they have a lot of independent time to work on their workbooks, and a lot of students ask for help. I want to find ways to differentiate the method to make it sound easier and have them understand the concept a little better.
 - i) I will observe a small group of students, because there are a couple that ask me for help frequently during individual work.
- c) I will ask my classmate to see what methods she thought of with her grade level, and also look online for helpful ways of explaining the topic the students are on. The teacher teaches thoroughly and makes sure she goes over every step, so I need to find ways to cater to the students individually.
- d) I will discuss with the students and see if they understand the concept better with the way I explained. Ask questions to see if they really do get what I am trying to teach them. As a summative assessment, I will view their end of the unit assessments. This will allow me to view the methods they used, and see if the strategies I explained were helpful to them.

Visual as much as possible

Strategies i can quickly make visual

Learning is incomplete from previous grades

Focus on what is multiplication and division or what is a decimal

Quick back track so they understand the concepts
