#### Current event #5

Facebook has recently introduced a new virtual reality platform. Instead of the normal virtual reality you just use your smartphone and it can add graphics to the world through your phone. You can add effects to a room like paintings or rain clouds, and even pop-up informational boxes for products or locations. It can detect the place that the items are supposed to go. This is very similar to the snapchat filters.

This relates to emerging technology because everyone is using filters on there photos and videos, especially on snapchat. Now you can use facebook for the same thing. Something from class that I could relate to this is when we did the photo editing because that is what facebook is doing but in live video in real time.

The most interesting fact that I have learned from this is that it is able to add all kinds of effects to a room when looking through a phone.
