With the advent and increasing popularity of the Green movement and all the other environmentally-focused interest groups, there has been a corresponding growth in the rise of commercial solar power. As we speak, [commercial solar power](#) is being marketed to both the residential and business sectors. Multinational companies around the world have capitalized on the growing number of the so-called "Green Consumers." In fact, solar power panels and devices can be considered as one of the most sought-after items in this era where Environmentalism and Technology go hand in hand.

Studies and surveys have shown that the demand for solar energy, including commercial solar energy, has grown to about 30% per year over a 15-year span. And we do not have to wonder why. Solar energy is clean and it is renewable. And for most of environmentally-conscious people, that is a great thing. We have heard the bad news that revolves about how the earth is dying and how we should all do our share.

There are also a lot of positive news and studies that state how commercial solar power and its demand will continue to go up. But for us who cannot purchase those state-of-the-art solar panels, how can we save electricity by making use of an energy source that is supposed to be readily available for anyone?

We should not forget about the average Joe who also wants to keep his electricity bill from going up too high. Not everyone can easily afford to buy those expensive commercial solar panels and kits being sold in the market right now. True, the price of solar power cells and panels have gone down considerably when you compare them to the prices available 3-5 years ago but not everyone has access to thousands of dollars for the panels and for the installation costs. You can choose to loan but it would take years before you can pay back that amount. Shelling out thousands of dollars for their very own solar power panels may not be a big deal for big businesses and companies who have financial grants from their investors but how about the average American household? In these uncertain times, several American families are tightening their belts and one way to do that is to make the necessary steps to cut down on electricity bills, for instance.

However, with the rise of commercial solar power comes the rise in the number of consumers who also want to use solar energy to power their homes. So many people think that it would cost them an arm a leg just to buy one but there are a lucky few who know that they can make their own solar panels! It is not an impossible task and the rewards are great for those who are willing to give commercial solar power panels and the companies selling them a run for their money.
