UI/UX Designer
Test assignment

This is a test assignment, to check the skills of a candidate think globally, and understand different business models.

Join.To.IT

Imagine that our company received a restaurant table booking project. We need to develop a project prototype. It must be a schematic description of all elements on the page and comments with the functionality of every button, input, paragraph, etc. Our project will be a mobile application.

Full description of the project business model and workflow:

- Our client is the owner of a small restaurant in Chicago. His restaurant cooks only 5 types of burgers and sells 3 types of coffee: Americano, Espresso, and Latte.

- The application will give the ability to order a burger and a coffee in advance, so a visitor to the restaurant can come and grab his order without waiting.

- The system should provide functionality for the restaurant owner to see the orders. Visitors will be able to order coffee from the app. The payment will be online, please advise on the payment processor.

- The visitor will be notified when the order will be ready. Both visitor and restaurant should receive notifications about events that happen during every order business process.

- Visitors must have the ability to register fast in the system with several clicks. The restaurant must have a page to place information about their products and contacts.

Be creative. Imagine this system. Describe all pages of mobile application in Adobe XD review mode. One slide = one page. Describe in detail what happens when the user clicks each of the buttons, types in the order, and so on. Validation of data is a plus, but not a must. Important - task must be realized in Adobe XD and commented in Adobe XD link for review. Send Adobe XD file at the end of the task and a link for review with comments for every element of your prototype.

Good luck!
