

# Four Types of Breathing

1. **Breathing**- This involves the \_\_\_\_\_.
2. **External Respiration**- This is the \_\_\_\_\_ between air and blood in the alveoli.
3. **Internal Respiration**- When the \_\_\_\_\_ and receives CO<sub>2</sub> to be carried away. (We will revisit in our study of circulation.)
4. **Cellular Respiration**- The mitochondria in cells use oxygen to break down sugar to produce \_\_\_\_\_.

## Inhalation:

- The lungs are sealed in two sacs, called \_\_\_\_\_, inside the chest cavity.
- At the bottom of the chest cavity is a large dome-shaped muscle known as the \_\_\_\_\_.
- When you inhale, the diaphragm \_\_\_\_\_. Muscles between the ribs also contract, raising the rib cage.
- These actions increase the \_\_\_\_\_ and create a partial vacuum inside the cavity.
- Atmospheric pressure fills the lungs as \_\_\_\_\_ the breathing passages.

**Lungs expand and contract in response to changes in pressure inside the chest cavity.**

**Exhalation:**

- During exhalation, both the rib cage and the diaphragm \_\_\_\_\_, decreasing the volume of the chest cavity and making air pressure in the chest cavity \_\_\_\_\_.
- Air \_\_\_\_\_ back out of the lungs.
- Exhalation is usually a \_\_\_\_\_, but to blow out a candle, speak, sing, or yell, you need more force than passive exhalation provides.
- The extra force is provided by \_\_\_\_\_ between the ribs and abdominal muscles, which contract vigorously as the diaphragm \_\_\_\_\_.
- Breathing works only because the chest cavity \_\_\_\_\_.
- If a wound punctures the chest—even if it does not affect the lungs directly—air may leak into the chest cavity and make breathing impossible. This is one reason chest wounds are always serious.

### **Control of Breathing:**

- Breathing is controlled by the \_\_\_\_\_ (brain stem); it is an \_\_\_\_\_ process.
- When CO<sub>2</sub> levels get \_\_\_\_\_, the medulla oblongata sends a message to the rib cage muscles to contract.

### **Breathing and Homeostasis:**

- You have some \_\_\_\_\_ over your breathing—when you swim or play an instrument, for example—but breathing is not purely \_\_\_\_\_.
- Your nervous system has \_\_\_\_\_ of your breathing muscles whether you are \_\_\_\_\_.
- \_\_\_\_\_ is initiated by the breathing center in the part of the brain stem called the medulla oblongata.
- \_\_\_\_\_ in or near the medulla and in some large blood vessels gather information about carbon dioxide levels in the body and send the information to the breathing center.
- When stimulated, the breathing center sends \_\_\_\_\_ that cause the diaphragm and chest muscles to contract, bringing air into the lungs.
