

Comprehensive Overview of Counselling and Psychotherapy Options for Veterans and Their Families

This report outlines the **specific counselling and psychotherapy approaches available to Australian veterans and their families**. It details established methods, emerging therapies, and approaches tailored for distinct mental health challenges experienced within the veteran community. Each therapy type is presented with its purpose, application, and suitability for veterans, partners, and children.

1. Cognitive Behavioural Therapy (CBT)

Overview:

CBT is one of the most researched and widely used therapies for veterans. It focuses on the relationship between thoughts, feelings, and behaviours. Veterans often benefit from CBT because it provides **practical tools to challenge unhelpful thinking patterns and modify behaviours** contributing to psychological distress.

Applications for Veterans:

- PTSD
- Depression
- Anxiety Disorders
- Anger Management
- Chronic Pain
- Sleep Disorders
- Adjustment Disorders

Core Techniques:

- Identifying cognitive distortions (e.g., catastrophising, black-and-white thinking)
 - Behavioural activation for depression
 - Exposure to avoided situations
 - Thought-challenging exercises
-

2. Trauma-Focused Cognitive Behavioural Therapy (TF-CBT)

Overview:

TF-CBT is an adaptation of CBT specifically developed for trauma survivors, including **combat-related trauma**. It incorporates trauma-processing with cognitive restructuring and exposure-based techniques.

Applications:

- PTSD
- Complex PTSD
- Childhood Trauma
- Military Sexual Trauma (MST)

Core Techniques:

- Psychoeducation about trauma and PTSD
 - Emotional regulation skills
 - Gradual exposure to trauma memories (imaginal or in vivo)
 - Cognitive processing of trauma-related beliefs
-

3. Eye Movement Desensitisation and Reprocessing (EMDR)

Overview:

EMDR is an evidence-based trauma therapy that uses **bilateral stimulation (typically eye movements)** to help veterans reprocess traumatic memories so they lose their emotional intensity.

Applications:

- PTSD
- Complex PTSD
- Moral Injury (to some extent)
- Phobias
- Anxiety
- Military Sexual Trauma

Core Techniques:

- Identification of traumatic memories
 - Bilateral stimulation while focusing on the trauma
 - Reprocessing until distress subsides and adaptive beliefs emerge
-

4. EMDR 2.0

Overview:

EMDR 2.0 is an **enhanced, flexible model** of EMDR designed to **accelerate trauma processing**, often integrating elements like dual attention stimuli variations, enhanced resource installation, and faster targeting of 'stuck points.'

Applications:

- Complex trauma cases with dissociation
- Treatment-resistant PTSD
- Veterans with overlapping traumas

Core Techniques:

- Utilises more adaptive pacing of bilateral stimulation
 - Integrates somatic awareness and grounding techniques
 - Uses cognitive interweaves to speed up block resolution
-

5. Prolonged Exposure Therapy (PE)

Overview:

A cornerstone trauma treatment, Prolonged Exposure involves **systematic and repeated exposure to trauma memories and avoided situations** to reduce fear and avoidance behaviours.

Applications:

- PTSD
- Combat Trauma
- Military Sexual Trauma

Core Techniques:

- Imaginal exposure to trauma memories
 - In vivo exposure to feared but safe situations
 - Processing emotional reactions post-exposure
-

6. Cognitive Processing Therapy (CPT)

Overview:

CPT is a cognitive-focused therapy aimed at **restructuring maladaptive beliefs about traumatic experiences**. It is highly structured and effective for veterans.

Applications:

- PTSD
- Guilt and shame from combat or moral injury
- MST

Core Techniques:

- Challenging "stuck points" (e.g., beliefs about blame, trust, safety)
 - Written trauma accounts
 - Cognitive restructuring worksheets
-

7. Acceptance and Commitment Therapy (ACT)

Overview:

ACT combines mindfulness and behavioural strategies to help veterans **accept difficult emotions while committing to valued life actions.**

Applications:

- Chronic Pain
- PTSD
- Depression
- Anxiety
- Adjustment to Disability or Medical Conditions

Core Techniques:

- Defusion techniques (distancing from thoughts)
 - Acceptance exercises
 - Values clarification
 - Committed action planning
-

8. Logotherapy

Overview:

Founded by Viktor Frankl, logotherapy is a meaning-focused therapy suited to veterans grappling with **existential crises, loss of identity, and moral injury.**

Applications:

- Moral Injury

- Adjustment Disorders
- End-of-Life Care
- PTSD with existential components

Core Techniques:

- Exploring life purpose and meaning
 - Responsibility-focused reflection
 - Attitude adjustment toward unavoidable suffering
-

9. Psychotherapies Specific to Moral Injury

Approaches:

Moral Injury therapies focus on **healing the psychological and spiritual wounds** from events that violate a person's moral code.

Examples:

- **Adaptive Disclosure Therapy (ADT):** Combines exposure with confession-style dialogues addressing shame and guilt.
 - **Impact of Killing (IOK):** Targets guilt and moral injury specifically linked to combat actions.
 - **Building Spiritual Strength (BSS):** Integrates spiritual counselling and cognitive-behavioural tools.
-

10. Integrated Treatment for PTSD and Substance Abuse (Seeking Safety)

Overview:

A manualised treatment that **simultaneously addresses PTSD and substance abuse** through coping skills, grounding techniques, and psychoeducation.

Applications:

- PTSD + Alcohol/Substance Abuse
 - MST with substance misuse
 - Complex Trauma and Addiction
-

11. Motivational Interviewing (MI)

Overview:

MI is a brief, person-centred intervention that helps veterans **resolve ambivalence about change**. It is often the gateway to deeper therapy.

Applications:

- Alcohol & Drug Misuse
 - Smoking Cessation
 - Health Behaviour Change
 - Treatment Engagement
-

12. Couple Counselling: The Gottman Method

Overview:

Highly respected and evidence-based, the Gottman Method focuses on **improving communication, managing conflict, and building intimacy** through structured interventions.

Core Principles ("Sound Relationship House")

- Building Love Maps (understanding each other deeply)
- Fondness and Admiration
- Turning Toward Instead of Away
- Managing Conflict
- Making Life Dreams Come True
- Shared Meaning

Applications:

- Relationship strain post-deployment
- PTSD impact on couples
- Communication breakdown
- Infidelity and trust rebuilding

Core Techniques:

- The Four Horsemen assessment (Criticism, Contempt, Defensiveness, Stonewalling)
 - Love maps exercises
 - Conflict management dialogue
 - Rituals of connection development
-

13. Family Therapy

Overview:

Family Therapy recognises that **veteran issues impact the entire family system**. It addresses communication, dynamics, parenting, and trauma impact collectively.

Types:

- Structural Family Therapy
- Strategic Family Therapy
- Narrative Family Therapy
- Systemic Family Therapy

Applications:

- Reintegration challenges
 - Intergenerational trauma
 - Communication breakdown
 - Parenting post-trauma
-

14. Counselling and Psychotherapies for Children of Veterans

Child-Focused Therapies:

Children of veterans, especially those with PTSD or moral injury, often exhibit anxiety, depression, behavioural issues, or secondary trauma responses.

Therapeutic Approaches:

- **Play Therapy:** For younger children to express feelings through play.
- **Art Therapy:** Helps children externalise and process emotions.
- **CBT for Children (CBT-C):** Modified CBT suitable for managing anxiety, depression, and trauma symptoms in children.
- **Trauma-Focused CBT for Children (TF-CBT-C):** Adapts TF-CBT for child developmental levels, including parental involvement.
- **Parent-Child Interaction Therapy (PCIT):** Builds stronger attachment bonds, corrects behaviours, and increases positive communication.
- **Attachment-Based Therapy:** Addresses relational trauma and fosters secure attachment, particularly after deployments.

Applications:

- Anxiety
- Depression
- Behavioural Disorders
- Trauma / Abuse

- Adjustment to parental reintegration
-

15. Group Therapy for Veterans and Families

Overview:

Group settings often foster a **sense of belonging and normalise experiences**. Peer validation is highly beneficial for veterans.

Types:

- PTSD Skills Groups (CBT or ACT-based)
 - Anger Management Groups
 - Substance Abuse Recovery Groups
 - Moral Injury Processing Groups
 - Family Support Groups
 - Veteran Spouse/Partner Groups
-

16. Emerging and Complementary Approaches

Narrative Exposure Therapy (NET):

Used for complex trauma, NET involves constructing a **coherent life narrative to integrate traumatic events** into the broader life story.

Schema Therapy:

Addresses **deep-seated maladaptive patterns** (schemas) often rooted in childhood, applicable in complex trauma.

Compassion-Focused Therapy (CFT):

Designed for individuals with **high shame and self-criticism**, such as those with moral injury or military-related guilt.

Mindfulness-Based Therapies (MBCT, MBSR):

Integrates mindfulness into relapse prevention for depression, PTSD symptom reduction, and chronic pain management.

Summary: Matching Therapy to Veteran Needs

Condition	Recommended Therapies
PTSD	TF-CBT, EMDR, PE, CPT, ACT, NET
Moral Injury	ADT, IOK, Logotherapy, BSS, CFT
Depression	CBT, ACT, MBCT, Schema Therapy
Anxiety Disorders	CBT, ACT, EMDR, Mindfulness
Substance Abuse	MI, CBT, Seeking Safety, Group Therapy
Relationship Strain	Gottman Method, Family Therapy, EFT
Children of Veterans	Play Therapy, Art Therapy, TF-CBT-C, PCIT
Chronic Pain	ACT, CBT, Mindfulness-Based Interventions

Conclusion

Veterans and their families benefit from a diverse array of evidence-based counselling and psychotherapies tailored to the complexities of military service, trauma, and reintegration into civilian life. Each therapy addresses distinct psychological, relational, and developmental needs. Veteran advocates should encourage informed choices among these therapies, ensuring alignment with the veteran's unique experiences, diagnoses, and goals.
