Privacy Policy

Welcome to Rememberry! This app helps you seamlessly track medicine expirations, credit cards, gift cards, subscriptions, and customized friend/family birthday countdowns with smart notification alerts.

1. Where is my personal data stored?

Everything is stored locally on your device in a secure SQLite database. We prioritize your privacy above all, meaning your expirations, birthdates, display names, and profile photos never leave your device. You can create secure, private manual backup files to move your data between devices.

2. How do manual backups work?

You can create a portable snapshot of all your entries using the 'Local Import & Export' tools in Settings. 'Export JSON' packs all dates and notes into a secure 'rememberry_backup.json' file in your Downloads folder. You can store this file safely or copy it to other devices to 'Import JSON' later.

3. What happens if I forget my security PIN?

For absolute privacy and local integrity, your 4-digit passcode is cryptographically verified locally on your device with zero backdoors.

IMPORTANT WARNING:

If you forget your passcode, you will NOT be able to access your data or recover your items. There is no remote password reset service. Your only recovery path would be to clear app data and restore from a previously exported JSON backup file. Please make sure to remember your passcode or export backups regularly, and keep your PIN stored in a safe password manager.

4. How do birthday & expiry alerts work?

When notifications are enabled, the app schedules precise system alarms. Expiry reminders can alert you on the day of expiry (at 9:00 AM) or up to 30 days early based on your preference. Birthday notifications alert you of the age they are turning and can also trigger early buffers.
