

WILL FRANCE CHANGE ITS ENERGETIC RESSOURCES AND STOP CONSUMING NUCLEAR?

KEY WORDS : POLITIC, SARKOZY, NUCLEAR

The information conveyed is very interesting. Indeed, the question of the nuclear energy is a new debate that may be extended at the international scale. Since the explosion of Fukushima nuclear power station, people are scared and this terrible event has entertained doubt and questionings of both the politics and the citizens. **The press article explains** MR SARKOZY's position toward the use of Nuclear in France. To him, nuclear represents one of France's biggest strengths and renouncing to this energy would be an error... to him. While Mr. SARKOZY is so optimistic, he seems to forget that a new ecological plan planned for 2020 will force France to produce 27% of its electricity with renewable energies. So, Mr. SARKOZY seems to forget all the ecological alternatives available. **Personally**, this article rebels me! I'm fed up with the fact that politics always take decision for us. After the disaster of Chernobyl in 1983 and now the explosion of Fukushima, I don't understand the reaction of MR SARKOZY. Thus, while the media are alarming the citizens, while we don't already know the impacts, the consequences of the recent explosions in Japan, France is taking useless risks. With the difficult economic situation of France, the argument of the president saying that «the end of the nuclear will force the citizens to pay all the energy the industries need 40% more expensive and that it will be insurmountable for most of us», I find it true. But then, the new question is the following one, is the economy more important than the environment, than the human being? I don't think so. To me, nuclear is dangerous and the use of this energy scares me!
