

Welcome to my presentation about the video game Minecraft. It was created by Markus Persson, also known as Notch. The first version of Minecraft was released on May 17, 2009 but the full release was on November 18, 2011. In the Year 2014 Microsoft bought Minecraft for 2.5 billion US\$. After this Notch left Mojang and worked no longer on Minecraft.

Minecraft it's an open world 3D sandbox game. You can explore a custom generated world and find some random spawn structure in there. The world is made of one-cubic-meter-sized blocks that different depending on which biome you are in. You can break and pick up them and craft out of them tools or other stuff . There are also mobs, some friendly and some dangerous. If you can kill them they also drop stuff. Or you mine for ores to make better stuff. But you can also find redstone with them and you can make circuits with logic. If the Overworld is not enough for you, you can go to the Nether. There it gives many lava and no friendly mods, but there is an important thing if you want to beat the game it is 7 blaze rods because out of them can you make 12 blaze powder and out of them can you make with ender pearls the drop a enderman if you kill them ender eyes the you need to find the end portal and activate it. When you think you are ready you can activate the end portal and go to the dimanson end. Kill there the ender dragon and beat with this the game.
