**MARKING SCHEME**

### Question One

Volume of pipette used = 20.00cm<sup>3</sup> (0.5 mark)

Table of results

|                                                     | Pilot | I     | II    | III   |
|-----------------------------------------------------|-------|-------|-------|-------|
| Initial burette reading (cm <sup>3</sup> )          | 0.000 | 0.00  | 0.00  | 0.00  |
| Final burette reading (cm <sup>3</sup> ) Under POP  | 10.30 | 10.20 | 10.10 | 10.20 |
| Final burette reading (cm <sup>3</sup> ) Under (MO) | 25.70 | 25.40 | 25.50 | 25.40 |
| Titer volume (cm <sup>3</sup> ) Under (POP)         | 10.30 | 10.20 | 10.10 | 10.20 |
| Titer volume (cm <sup>3</sup> ) Under (MO)          | 15.70 | 15.40 | 15.50 | 15.40 |

Average titre volume under POP =  $\frac{V_1+V_2+V_3}{3} = \frac{10.20+10.10+10.20}{3} = 10.17 \text{ cm}^3$  (00 ½ Mark)

Average titre volume (Under MO) =  $\frac{V_1+V_2+V_3}{3} = \frac{15.40+15.50+15.40}{3} = 15.43\text{cm}^3$  (00 ½ Mark)

Distribution of marks on the table of result should be as follows;

- Well completed table (C.T) 01 mark
- Decimal place (DP) 01 Mark
- Accurace (AC) 01 marks

### Summary

**20.00cm<sup>3</sup>** of solution B<sub>1</sub> required 10.17 cm<sup>3</sup> of solution B<sub>2</sub> under POP and **15.430cm<sup>3</sup>** of B<sub>2</sub> under MO. (01 mark)

(a) Molarity of solution B<sub>2</sub>.

Given concentration of HCl 14.6 g/dm<sup>3</sup>

Molar mass of HCl = (1+ 35.5) g/mol = 36.5g/mol

Molarity (14.6/36.5) mol/dm<sup>3</sup> = 0.4M (01 mark)

From a dilution law

M<sub>1</sub>V<sub>1</sub> = M<sub>2</sub>V<sub>2</sub> 00½ marks

M<sub>1</sub> = 0.4M.

V<sub>1</sub> = 100cm<sup>3</sup>

M<sub>2</sub>=? 00½ marks

V<sub>2</sub> = 200cm<sup>3</sup>.

$$M_2 = \frac{M_1 V_1}{V_2}$$

$$M_2 = \frac{0.4M \times 100\text{cm}^3}{200\text{cm}^3}$$

M<sub>2</sub> = 0.2M. 00½ marks

Molarity of solution B<sub>2</sub> = 0.2M

**00½ marks**

(b) volume required to neutralize

i. Na<sub>2</sub>CO<sub>3</sub> only.

Volume under POP × 2

$$10.17 \text{ cm}^3 \times 2$$

$$= 20.34 \text{ cm}^3$$

**(00½ Mark)**

ii. NaHCO<sub>3</sub> only

$$= 15.43 \text{ cm}^3$$

But Original NaHCO<sub>3</sub> which is pure is Volume of B<sub>2</sub> under MO – Volume of B<sub>2</sub> under POP

$$= (15.43 - 10.17) \text{ cm}^3$$

$$= 5.26 \text{ cm}^3$$

**(00½ mark)**

(c) Molarity of (i) NaHCO<sub>3</sub>

Consider the chemical equation below

**(00½ mark)**

Given:

Volume of acid (V<sub>B2</sub>) to neutralize pure NaHCO<sub>3</sub> = 5.26 cm<sup>3</sup>

Molarity of B<sub>2</sub> (M<sub>B2</sub>) = 0.2M

Volume of Base (V<sub>B1</sub>) = 20cm<sup>3</sup>

$$\frac{M_a V_a}{M_b V_b} = \frac{n_a}{n_b}$$

**(00½**

**Mark)**

$$\frac{0.2 \times 5.26}{M_b \times 20} = \frac{1}{1}$$

**(00½ Mark)**

$$M_b = 0.05\text{M}$$

**(00 ½ Marks)**

Concentration in mass per liter solution = Molarity X molar mass

Molar mass of NaHCO<sub>3</sub> = 23+1+12+16 x 3 = 84g/mol.

**(00½ mark)**

$$0.05\text{mol/dm}^3 \times 84\text{g/mol}$$

**(00 ½ Marks)**

$$4.2 \text{ grams per litre solution (4.2g/dm}^3\text{)}$$

**(00 ½ Mark)**

ii) Molarity of Na<sub>2</sub>CO<sub>3</sub>

Consider the Chemical equation below

Given:

Volume of acid ( $V_{B2}$ ) to neutralize pure  $\text{Na}_2\text{CO}_3 = 20.34 \text{ cm}^3$  **(00½ Mark)**

Molarity of  $B_2$  ( $M_{B2}$ ) = 0.2M

Volume of Base ( $V_{B1}$ ) =  $20 \text{ cm}^3$

$$\frac{M_a V_a}{M_b V_b} = \frac{na}{nb} \quad \textbf{(01 Mark)}$$

$$\frac{0.2 \times 20.34}{M_b \times 20} = \frac{2}{1}$$

$M_b = 0.10 \text{ M}$  **(00 ½ Mark)**

Concentration in mass per liter solution = Molarity X molar mass

Molar mass of  $\text{Na}_2\text{CO}_3 = 23 \times 2 + 12 + 16 \times 3 = 106 \text{ g/mol}$ . **(00 ½ Mark)**

$0.10 \text{ mol/dm}^3 \times 106 \text{ g/mol}$  **(00 ½ Mark)**

10.60 grams per litre solution ( $10.6 \text{ g/dm}^3$ )

Total mass of pure  $\text{NaHCO}_3$  and  $\text{Na}_2\text{CO}_3 = (4.2 + 10.6) \text{ grams}$  **(00½ Marks)**

$= 14.8 \text{ grams}$  **(00 ½ Mark)**

(ii)  $\text{Na}_2\text{CO}_3 \cdot X \text{ H}_2\text{O}$ .

Value of X

Total mass of Pure  $\text{Na}_2\text{CO}_3$  and  $\text{NaHCO}_3 = 14.6 \text{ grams}$

But mass of sample mixture was  $16.4 \text{ g}$   ~~$500 \text{ cm}^3$~~

?  ~~$1000 \text{ cm}^3$~~

$$= \frac{16.4 \text{ g} \times 1000 \text{ cm}^3}{500 \text{ cm}^3}$$

$= 32.8 \text{ g/dm}^3$  **(01 mark)**

Since Total mass of pure  $\text{NaHCO}_3$  and  $\text{Na}_2\text{CO}_3 = 14.8 \text{ g}$  and Total mass of sample mixture is  $32.8 \text{ g}$ , their difference in mass is impurity due to the water of crystallization.

$32.8 - 14.8 = 18 \text{ grams}$ . **(01 Mark)**

|              |                          |                      |
|--------------|--------------------------|----------------------|
|              | $\text{Na}_2\text{CO}_3$ | $\text{H}_2\text{O}$ |
| Mass         | 10.6                     | 18                   |
| ÷ molar mass | $10.6/106 = 0.1$         | $18/18 = 1$          |

|               |             |            |
|---------------|-------------|------------|
| ÷ by smallest | 0.1/0.1 = 1 | 1/0.1 = 10 |
|---------------|-------------|------------|

(01 Marks)

The ratio of  $\text{Na}_2\text{CO}_3$  to  $\text{H}_2\text{O}$  is 1: 10

(00 ½ Marks)

Therefore the water of Crystallization = 10.

It is  $\text{Na}_2\text{CO}_3 \cdot 10 \text{H}_2\text{O}$  (X = 10)

00½ marks

## 2. (a) Table of results

| Salt                                      | Volume of water (cm <sup>3</sup> ) | Mass of salt (g) | Initial temperature of water T <sub>1</sub> (°C) | Final temperature of solution T <sub>2</sub> (°C) | Temperature change (ΔT) | Molar weight of the sample (M <sub>r</sub> ) |
|-------------------------------------------|------------------------------------|------------------|--------------------------------------------------|---------------------------------------------------|-------------------------|----------------------------------------------|
| $\text{CuSO}_4$                           | 50                                 | 2                | 22                                               | 28                                                | +6                      | 160                                          |
| $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ | 50                                 | 4                | 22                                               | 21                                                | -1                      | 250                                          |

NB: Complete filled table (03 marks)

Accuracy (02 marks)

(b) To find enthalpy of solution in each salt:

**For  $\text{CuSO}_4$**

$$\Delta H = - (C_w \rho_w V_w \Delta T) \quad (00 \frac{1}{2} \text{ mark})$$

= - density of solution x volume of solution x specific heat capacity x temperature change

$$\Delta H = -50 \text{ cm}^3 \times 1.0 \text{ g/cm}^3 \times 4.18 \text{ J g}^{-1}\text{K}^{-1} \times 6^\circ \text{C} = - 1254\text{J} \quad (02 \text{ marks})$$

$$\text{Molar heat evolved} = \text{Heat evolved} \quad (00 \frac{1}{2} \text{ mark})$$

$$\begin{aligned} & \text{Number of moles of } \text{CuSO}_4 \\ & = - 1254\text{J} = -10,032 \text{ J/mol} \\ & (2/160) \text{ mol} \end{aligned}$$

Thus, molar heat evolved by  $\text{CuSO}_4$  was 10.032 kJ/mol (02 marks)

**For  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$**

$$\Delta H = - (C_w \rho_w V_w \Delta T) \quad (00 \frac{1}{2} \text{ mark})$$

= - density of solution x volume of solution x specific heat capacity x temperature change

$$\Delta H = -50 \text{ cm}^3 \times 1.0 \text{ g/cm}^3 \times 4.18 \text{ J g}^{-1}\text{K}^{-1} \times -1^\circ \text{C} = 209\text{J} \quad (02 \text{ marks})$$

Molar heat evolved = Heat evolved (00 $\frac{1}{2}$ mark)

$$\begin{aligned} & \text{Number of moles of CuSO}_4 \cdot 5\text{H}_2\text{O} \\ & = 209 \text{ J} = 13,062.5 \text{ J/mol} \\ & (4/250) \text{ mol} \end{aligned}$$

Thus, molar heat absorbed by  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  was 13.06 kJ/mol (02 marks)

### Question Three

| s/n | Experiment                                                                              | Observations                                                                                                                                                                                 | Inferences                                                                                                                                                                                                                        |
|-----|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | The appearance of sample K                                                              | White crystalline sample x with no characteristic smell. <b>(00½ Marks)</b>                                                                                                                  | Transition element absent <u>or</u> non – transition element may be present <b>(00½ Mark)</b><br>$\text{CO}_3^{2-}$ , $\text{HCO}_3^-$ may be absent or so, $\text{NO}_3^-$ , $\text{SO}_4^{2-}$ or $\text{Cl}^-$ may be present. |
