Federalism 2.0. Congress should be the nation's premier data distributor for shared public purpose in support of Article One in the US Constitution. Modern technology and data can build a credible and authentic supply chain of information from local communities into lawmaking. This powerful civic evidence capacity across the USA will serve as a public listening and memory infrastructure in policy making. Here is the **First Branch LLM Concept map**, an enterprise system that will create accessible, accountable and permanent information resources for use by the public and lawmakers. Note the transformational role of Federal Depository Libraries as local civic data hubs. At its best, the First Branch LLM will be a trust engine, a sensemaking layer filled with local wisdom to benefit decision making for the public interest. It will also build a richer record for statutory clarity and interpretation–critical in the post Chevron Congress.(See Supreme Court Loper-Bright decision) Note the civic voice component, which is newly possible due to the rise of deliberative technology and voice into data capture and labelling. Authentication thru in person and human vouched-for information will become more critical as AGI advances. This model was prompted by the House Modernization Recommendations and the Public AI ecosystem. Here is the Tech Policy Press article with details. I'll be updating the map this year with results from local impact hearings. Contact: Lorelei.Kelly@georgetown.edu
