### **STUDENT'S DECLARATION**

I, the undersigned really report that the Dissertation Impediments in attainability activities of conduits in India: A beat up investigation depends upon my own special work did over the scope of our examination under the supervision of Dr. Rajesh Tripathi. I bear witness to the statements made and closes drawn are an outcome of my examination work.

- I further bear witness to that I. The work contained in the report is momentous and has been finished by me under the general supervision of my manager.
- The work has not been submitted to some other Institution for some other degree/affirmation/affirmation in this school or some other University of India or abroad.
- We have looked for after the standards given by the school recorded as a printed adaptation the report.
- Whenever we have utilized materials (information, hypothetical examination, and substance) from different sources, we have given due credit to them in the substance of the report and giving their subtleties in the references.

Ronak Gautam

BBA Oil and Gas Marketing

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **ACKNOWLEDGEMENT**

As an issue of first significance, I should need to thanks my individual coach "Dr. Rajesh Tripathi" for his critical heading and reassurance all through my endeavor on "**Study of reverse logistics as a tool of customer dissonance mitigation**". His authority, Energy, and responsibility for work have been unfaltering wellspring of motivation for me.

I should need to offer my significant gratitude to "School of Business" for expanding the opportunity of encountering the endeavor and giving each and every imperative resource and fitness required for climax of the endeavor.

Name: Ronak Gautam

Enroll no. : R170217030

Course : BBA Oil and Gas Marketing

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **EXECUTIVE SUMMARY**

Consumers regularly react to the idea of restoring a product with a moan. Many discover the procedure a bother, a cerebral pain, or more regrettable, abstain from making returns at all and simply keep the inadmissible product since making the arrival isn't advantageous. Firms infrequently take a gander at extricating an incentive from returns from a shopper administration point of view, concentrating exclusively on less waste, more prominent recuperation of product, and proficient exchanging, so there is a solid open door for development right now. This could bring about clients declining to shop at specific retailers and enormously influence a company's incomes. Individuals regularly return products for an assortment of reasons including erroneous size, shading, or fit, flawed products, or even just altering their perspective on the product.

These basic reasons can make retailers ingest noteworthy converse coordinations costs per return. For organizations to have the option to recover a portion of this cost, it is significant that clients have a positive returns experience. Realizing that they can return unacceptable products rapidly and effectively, consumers are bound to make spur of the moment purchases, increment their buying volume, and increment their lifetime client esteem. Returns are likewise an issue for organizations in such a case that they are misused they can go about as a hindrance for customers. Along these lines, to keep clients fulfilled it is significant that retailers put resources into sufficient returns the board forms.

Since the momentum literature prohibits the retailer-shopper relationship and the going with set of desires every buyer has for a retailers' returns experience, the system of this examination flourished. Consumers are all over the place and are open reserves of data, making this theme a significant and attainable exercise into what comprises the best returns experience a retailer can give dependent on buyer understanding. The reason for this exploration is it recognizes the three biggest factors that sway consumers' returns experiences just as move that retailers can make to meet and surpass purchaser desire at each arrival exchange.

## **Chapter 1**

### **Introduction**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Introduction**

Reverse logistics is one of numerous lines of research in the territory of supply chain management with developing significance. The reverse logistics applies to the progression of products and materials the other way to coordinate logistics, from the market to the production destinations or the particular habitats, where they are sent to be fittingly treated [Gandolfo, Sbrana 2008, p. 28]. The most widely recognized motivation behind why companies choose to reverse their supply chains is cost decrease by reusing products and parts that have been come back from the last utilization point to the producer.

The subsequent explanation is online business, where the likelihood of returns is a lot higher. There are two standards of goods in reverse chain: the flood of returned products and the waste stream. The returned product stream moves the other way to the stream in traditional supply chain – from the shopper through the middle people to the producer. Contingent upon how the arrival arrange is composed, the dealer returns the product to the distributor and afterward returns it to the maker. Products that are come back to the makers are fixed or handled by them and afterward are come back to the market utilizing the great supply chain. At the point when products are not reusable they will be dismantled. Their segments, contingent upon the potential for additional utilization, go to the recyclers, at that point to the providers of the products or to the makers. Parts or segments that can't be additionally utilized are taken to a landfill. So as to make this framework work proficiently, it is essential to attempt to estimate the interest of returned goods from consumers and to actualize great correspondence between the gatherings in question – the customer, the distributor, the producer and the provider of the crude materials.

Right now, the market is continually changed and is turning out to be increasingly requesting. Administrators in numerous industries are starting to see that the activities taken by one individual from the supply chain influence the productivity of others. It is likewise fundamental for companies to know that reverse logistics can bring environmental and economic benefits. It is progressively gainful to recover or fix a returned article than to create it from zero. Progressively liberal laws on purchaser rights should fill in as a help to this procedure. So as to guarantee the correct after-deals service, companies must put resources into suitable apparatuses to deal with returns and customer complaints. An effective return

## **Study of reverse logistics as a tool of customer dissonance mitigation**

and protest management framework adds to the seriousness of undertakings and improves customer service.

### **Logistics customer service**

In the course of recent years a major change in companies' disposition towards customers has been taken note. The customer has become the focal point of all market exercises, he is the principle driver of progress. So as to succeed, Peters and Waterman in their smash hit book „In Search of Excellence" prescribed „to draw near to the customer" [Peters, Waterman 1982, p. 219]. This motto can have various implications, however without question, the most significant is the brisk reaction and affectability to customer's requests. Customer direction implies that more consideration is paid to customer's needs, all re-sources are overseen in such way that will assist with fulfilling his needs in legitimate manner [Kempny 2009, p. 74].

The fundamental reasons that have changed the consciousness of companies and the market circumstance could be, right off the bat, the consistent increment of customer's desires – the purchaser has changed and turned out to be all the more requesting. In addition, mechanical purchasers expect more significant levels of service which is impacted by the execution of „on time" production. Also, markets are changing towards the “commodity” markets. It implies that the job of brands or the innovation used to create serious goods is reducing, making it progressively hard for the normal purchaser to get a handle on the greater contrasts between them [Christopher, 1998, p. 41].

Thirdly, globalization – the opening of world markets with a high chance of decision, is the motivation behind why companies can feel the accentuation to deliver top notch goods all together not to lose their upper hand. Fourthly, there are quickening changes in nature, result of which is the need to abuse existing chances and to maintain a strategic distance from the potential and genuine dangers [Pokusa, 2001, p. 14]. So as to accomplish competitive favorable position, companies ought to recognize customers' needs more viably and change all assets to fulfill their wants. The reason for progress is the joining of all organization key viewpoints, that comprise of assets, abilities and capabilities. Now days, consumers regularly need to pick between practically indistinguishable products that per-structure similar

## **Study of reverse logistics as a tool of customer dissonance mitigation**

capacities. Right now, decision of a specific thing will be hindered by a factor like cost, yet in addition by improving the organization picture in the extra worth, for instance, of customer service. In the literature customer service is characterized in various manners.

Fundamental investigation shows that researchers characterize customer service in an assortment of ways, concentrating on various angles. As indicated by the consequences of the definition study, customer service incorporates activities of finance, logistics and marketing. Finance incorporates components identified with the exchange of expenses from the organization to the purchaser, benefit direction and economic agreement that will assist with accomplishing an upper hand. Logistics gives the opportune spot, time and after-deals support, for example, returns and complaints. Marketing holds onto immaterial resources, for example, including esteem, incorporating with the customer, making a one of a kind security between the customer and the organization, and giving a specific standard of service.

### **Fundamentals Of Reverse Logistics**

Fleischmann and Dekker (2004) give the essentials of Reverse Logistics by breaking down the point from four perspectives:

- Why are things returned? and for what reason do companies engage in reverse logistics?
- How Reverse Logistics functions by and by?
- What is being returned?
- Who is executing reverse logistics exercises? For what reason do companies engage in reverse logistics exercises?

All in all companies engage in reverse logistics

- because they can benefit from it; or/and
- because they need to; or/and
- because they "feel" socially persuaded to do it.

Furthermore Fleischmann and Dekker order these three main thrusts as:

## **Study of reverse logistics as a tool of customer dissonance mitigation**

- Economics ( direct and indirect)
- Legislation
- Corporate citizenship Economics Reverse logistics programs bring both direct and indirect additions.

Direct gains can be:

- In the type of crude materials for new products.
- Some pieces of the returned product perhaps recycled to manufacture new products, therefore reducing the assembling cost.
- Value included recovery.

Indirect gains can be:

- Anticipating/obstructing legislation
- Market insurance
- Green image
- Improved customer/supplier relations

Legislation In numerous nations customers are legitimately qualified for return the product and legislation expresses that the companies are responsible for recovery also. And here and there companies themselves partake in recovery projects to keep or create a spotless and green image.

Corporate citizenship Many companies assume liability for the sheltered removal or recycling of their products to keep up the earth safe. Regularly companies engage in recovery and recycling projects and turn create awareness among their customers too.

**For what reason are things returned?**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

Customers return the products for a few reasons. Products once purchased might be returned because of physical harm, some of them are returned because the customers are discontent with the usefulness of the product (desires not met), once in a while customers return products because they find an elective product with better usefulness after they have made the buy, now and then customers misuse the return approach and return it with no reason. These are just a portion of the significant reasons for the return of a bought product by greater part of the customers.

### **How Reverse Logistics process functions?**

The how perspective arrangements with how is esteem recovered from the products that are returned back to the manufacturer. Recovery is in reality just one of the exercises engaged with the entire reverse logistics process. First there is assortment, next there is the joined investigation/choice/arranging process, thirdly there is recovery, and at last there is redistribution. Assortment refers to carrying the products from the customer to the point of recovery. Now the products are examined, for example their quality is evaluated and a choice is made on the kind of recovery. Products would then be able to be arranged and directed by the recovery that follows. In the event that the quality is (near) "all around great", products can be taken care of in the market very quickly through re-use, re-deal and re-dispersion. If not, another sort of recovery might be included however now demanding more activity, for example a type of re-processing.

Re-processing can happen at different levels: product level (repair), module level (refurbishing), segment level (remanufacturing), specific part level (retrieval), material level (recycling), vitality level (cremation). What is being returned? The third perspective on reverse logistics is gotten by seeing what is really being returned. The three product attributes that are relevant right now:

- Composition
- Deterioration
- Use-pattern

## **Study of reverse logistics as a tool of customer dissonance mitigation**

**Composition Design:** engineers need to remember the material composition of the products they plan, which is called structure for recovery. Not all pieces of a product can be handily recycled or arranged, so plan specialists need to remember not to use unrecyclable material however much as could be expected. How these parts are gathered or joined to one another additionally plays a factor right now, so does the size of the product itself. The expense for recovery increases as the size of the product increases, because the majority of the occasions the recovery esteem is not exactly the expense for recovery.

**Deterioration:** Next there are the deterioration attributes, which in the end cause a nonfunctioning of the product, yet in addition decide if there is sufficient usefulness left to utilize the product, either overall or as parts. Regularly manufacturers need to manage addresses like whether the product will age during use. Will all parts age similarly? Will the estimation of the products decay quick? And so forth

**Use-pattern:** Use-pattern of the product likewise assumes a significant job when pondering recovery. Use-pattern relies upon who the user is and how the user has used the product. Products like PCs for example could have been used by an individual or numerous people, as in an office or school or library, so this influences the reusability of the parts or entire product in different degrees. Books are another model for differed utilization. Use-pattern isn't simply influenced by number of users yet in addition the term of use. In whole the accompanying product classifications can be given:

- Consumer goods (apparel, furniture, and a tremendous assortment of goods)
- Industrial goods (military and expert hardware)
- Spare parts
- Packaging and dissemination things
- Civil articles (building, embankments, spans, streets etc...)
- Ores, oils and chemicals
- Other materials (like mash, glass, scraps)

### **Who is executing reverse logistics exercises?**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

The three primary members in the reverse logistics exercises can be given as:

- Forward supply chain entertainers (supplier, manufacturer, wholesaler and retailer)
- Specialized reverse chain players (middlemen, recycling experts etc...)
- Opportunistic players, (for example, good cause associations) In any reverse logistics chain two or more of these players are constantly included. Frequently, a couple of these members assume the significant job while others act merely as middle intersections.

### **Return Management**

Return management is the way toward returning product just as the change of the product back to reusable condition. Returns Management uses devices and frameworks to amplify benefits all the while. Rogers and Tibben-Lembke (1998) notice seven channels for arranging the products that have been returned to the manufacturer.

In light of the condition of the returned product, legally binding commitments with the vendor, and the demand for the product, the manufacturer has one or more of the above choices to arrange the returned product.

**Return to vendor:** Regularly the vendor offers motivators for huge requests, and retailers purchase products in mass. On the off chance that the product doesn't do well in the market the retailer returns the products to the vendor. So also if a customer returns a product because of a deformity or asserting that it has an imperfection, the manufacturer might want to take it back in order to keep away from such deformities in the future, and additionally thusly they can maintain a strategic distance from non-damaged defectives. Another reason the manufacturer might want to reclaim the product could be to maintain a strategic distance from cannibalization of the parts and keep the brand name clean. Because frequently what happens is the product is sent to a secondary market where modest parts are introduced on the product and sold at a reduced cost at a swap meet or dollar store.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

**Sell as New:** A portion of the returned products are either unused or unopened; in such cases the manufacturer can repackage and sell it as new to the retailers or an outlet store, contingent upon the demand of the product. Then again a few products like circuit breakers are not lawfully permitted to be sold once it has been returned regardless of whether it has been introduced for a brief period or never been introduced.

**Sell Via Outlet or Discount:** On the off chance that the product has been returned, or if the retailer has too enormous a stock, it very well may be sold by means of an outlet store. Selling through outlet stores has various points of interest like keeping up power over the products, and the information on where the products are being sold. This helps firms in keeping up their brand name. Frequently outlet stores offer an enormous edge than the retailers, because a definitive objective here is to get out stock.

**Sell to Secondary Market:** When a firm has been not able to sell a product, can't return it to the vendor, and can't sell it at an outlet store, one of its last alternatives is to sell it by means of the secondary market. The secondary market comprises of firms that represent considerable authority in purchasing close-outs, excess, and rescue things, at costs as low as ten pennies on the dollar.

**Give to Charity:** The products that can't be offered to the retailers or vendors, because they need slight repair or corrective changes, manufacturers may decide to give them to a foundation. Right now manufacturer doesn't receive any cash, however the image of the organization will have a constructive outcome as a decent corporate resident.

**Remanufacture/Refurbish:** Before a product is sent to recycling the manufacturer has the alternative to check whether it tends to be repaired or reconditioned by either replacing pieces of the thing or by rolling out corrective improvements, with the goal that it very well may be offered to the secondary market where they will be sold as reconditioned goods or remanufactured goods. However, it is additionally important to ensure the product has never been used by the returning customer, because regardless of how well the refurbishing or reconditioning process is it can't be sold in certain markets.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

**Materials Reclamation/Recycling/Landfill:** There are a few reasons for sending a thing to the landfill for instance a few goods can't be resold in any structure because of security regulations. Another reason is the point at which the manufacturer has discovered that there is no real way to get any an incentive from the returned thing. The last choice is to send it to material reclamation to take out the parts which can be recycled for material or the part itself. The other choice is to recycle the material, similar to parts made out of plastic, metal etc...The last choice is obviously to send it to landfill. The things for the most part sent to landfill are considered as waste material, and which has no use to anyone. The manufacturer obviously needs to try to avoid potential risk 18 before sending it to the landfill like refining, cleaning, and isolating unsafe and non-dangerous material.

**Making the right choice:** Any of the choices depicted above can be effectively applied separately or in blends by the manufacturer. The choices run from significant expense and high management support to beneficial and low management upkeep. Making the right choice requires the capacity to characterize the normal result, use the correct system or mixes of the strategies and devices for every circumstance, and then convey the results as arranged utilizing the resources. Frequently companies use software and online apparatuses that help finding, following, and overseeing products as they are returned. Anyway these arrangements just assistance to get the product returned effectively. Product quality despite everything should be ensured to prepare it for the resale choices.

Redistributing frequently produces more worth gave an accomplice who has vital esteem and can execute forms that fit the business requirement for the parent organization is chosen. The inquiries that should be posed by the parent organization can be along the lines of "How might you create a comprehensive returns management plan for our products that:

- assists with reducing the quantity of returns that must be managed from our customers,
- changes inherently negative customer experiences into an important key asset, and
- produces benefits from returns that were previously a misfortune.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

**Gatekeeping:** is the screening of inadequate and unjustifiable returned merchandise at the section point into the reverse logistics process. Great gatekeeping is the main basic factor in making the entire reverse stream sensible and productive. Regularly in companies where the return strategies are merciful consumers will in general abuse their benefits. Additionally customers sometimes don't read the guidelines of the return strategies correctly, which leads superfluous difficulty for the retailers and thusly the manufacturer. A decent 20 gatekeeping procedure can help the manufacturer in keeping this to as low as could be expected under the circumstances.

**Compacting Disposition Cycle Time:** Just like gatekeeping shorter disposition cycle time is a significant factor in overseeing returns. Frequently it is hard for companies to figure out which reverse logistics channel the returned product ought to be put in. The sooner this is resolved move can be made that rapidly. Companies are continually contemplating shortening their production cycle times, however it is similarly as significant for them to conservative the reverse cycle time too to pick up cash from the returned product.

**Reverse Logistics Information Systems:** The data encompassing the reverse logistics should be mechanized so as to have a superior reverse logistics process. Very few companies have great data frameworks set up for doing as such. Simultaneously assembling the data to be available is a troublesome activity.

**Returns Transaction Processing:** when all is said in done not many companies have mastered the innovation of following their products in forward supply chain, and essentially none have accomplished just beneath normal innovation in the reverse procedure. Right now the retailer and manufacturer have coordinated their data frameworks to accomplish a type of a working following procedure.

**Centralized Return Centers:** Returns focuses have existed for a long time, however recently the full use of centralized return places has been accomplished by assembling companies. In a centralized framework all products for the reverse logistics pipeline are brought to a focal office, where they are arranged, procedures, and then transported to their next goals. This framework has the advantage of the reverse logistics stream customers, which regularly

## **Study of reverse logistics as a tool of customer dissonance mitigation**

prompts higher revenues for the returned things. Likewise this procedure can help in deciding the right reverse channel for the returned thing.

**Zero Returns:** In zero return programs, the manufacturer or distributor doesn't allow products to return through the return channel. Rather, they give the retailer or other downstream substance a return recompense, and create rules and rules for adequate disposition of the product. The zero return strategy frequently will in general have a negative impact in customer fulfillment and thusly the brand image.

Remanufacture and Refurbishment Thierry, et al. (1995) characterized five classifications of remanufacture and refurbishment. These five classifications, are repair, refurbishing, remanufacturing, cannibalization, and recycling.

The initial three classifications: repair, refurbishing, and remanufacturing, include product recondition and overhaul. Cannibalization is essentially the recovery of a restricted arrangement of reusable parts from used products. Recycling is the reuse of materials that were a piece of another product or subassembly.

**Asset Recovery:** Asset recovery is the characterization and disposition of returned goods, overflow, out of date, scrap, waste and abundance material products, other assets, in a way that boosts returns to the proprietor, while limiting expenses and liabilities related with the dispositions. Asset recovery is a significant activity in any organization, and this one of the significant methods for reducing waste, recovering revenue, and holding a green image in the general public.

**Negotiation:** The cost of a product is controlled by the expense for the organization to deliver it and the brand esteem, and a few other elements like marketing, etc...Similarly the estimation of the products that have been returned is additionally influenced by a few variables like age, degree of use, which used it, etc...No matter what the condition of the returned great is the cost is constantly debatable, this may not be a similar when products are moving in the forward supply chain.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

**Financial Management:** The way in to an effective reverse logistics process is acceptable financial management. Most firms put an excess of cash in superfluous and undesirable procedures, without really breaking down the requirements of their business. Firms need to research the right system for their business as opposed to following what every other person is doing indiscriminately. Because what works for one firm might possibly work another firm. Simply in the wake of leading investigation should they really contribute

**Chapter 2**  
**Literature Review**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Literature Review**

The shortage and the research hole right now drove the creator to embrace research in the area of reverse logistics, particularly considering the job and the significance of full worth product returns, just as the complaints with regards to their significance for customer fulfillment. Accomplishing the customer fulfillment is by all accounts increasingly conditioned by the proficiency and the speed of conveyance of returns and complaints. Additionally, it tends to be expected that each apparent customer who will have the option to easily return the product will be fulfilled and will make the buy by and by. Subsequently, each organization looking to create the upper hand is required to actualize the idea of reverse logistics and to treat it as a necessary component of its procedure. Right now, logistics can be seen as the component of framing positive relationships with customers and can add to the development of their dedication. The subject of research is the reverse logistics in relation B2C, and especially the relationship between the customer return management and customer fulfillment. Kateryna Lysenko-Ryba

Augmentation of used-product recovery methodologies is increasing in both the mechanical and service parts because of its environmental, economic and social benefits. The consistent supply of used product is basic for any product recovery as it unmistakably can't continue without reverse supply. The development of used products from the shopper to the producer in the appropriation channel is characterized as reverse logistics. The literature review indicated a few drivers for reverse logistics that authorize association for application, for example, legislation and commitment, increasing waste, customer awareness of green products. Numerous creators explained the benefits of reverse logistics application, for example, customer fulfillment, sparing expenses and arrangement of less expensive products in the market. The greater part of the previous examinations worry with showing the reverse logistics application in different area. In any case, there are not many investigations that analyzed the effect of reverse logistics on customer fulfillment. Therefore, this research explores the usage of reverse logistics for remanufacturing procedure in one of the substantial assembling segment, Caterpillar, and its operator in Egypt, Mantrac and its effect on customer fulfillment levels. The researchers used a contextual analysis way to deal with examine the utilization of reverse logistics in real life setting in Mantrac utilizing semi-structured meetings

## Study of reverse logistics as a tool of customer dissonance mitigation

that directed with the reverse logistics administrators for the situation. Then, questionnaire is used to test the research hypothesis which is the utilization of reverse logistics has critical effect on customer fulfillment.

Most reverse logistics researches have not incorporated marketing idea or customer direction into their systems. This investigation suggests that it is basic to take customer perspective in reverse logistics procedure to improve customer fulfillment. Therefore, the reason for this paper is to conceptualize and operationalize customer-arranged reverse logistics. It additionally looks at the relationship between the created build and its effect on customer fulfillment. Right now, literature review was completed to recognize customer-situated reverse logistics. In view of customer direction, service quality and service recovery literature, the new build was created. A pilot study was in this way directed utilizing the questionnaire review with directors and representatives of a specific organization in the versatile media communications industry and its customers who have experience in product returns. The discoveries indicated that the elements of the proposed build involved substantial quality, reliability, affirmation, sympathy, responsiveness, data accessibility and employee's strengthening. Way examination showed that customer-arranged reverse logistics saw by the two representatives and customers emphatically related to customer fulfillment of product returns service. The created build dependent on cross disciplinary in marketing and logistics could encourage future experimental examinations in reverse logistics area. The proposed structure will likewise be useful for professionals to actualize their product returns procedures as needs be.

## **Chapter 3**

### **Research Objective**

#### **Research Objective**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

- To understand the thought of Reverse Logistics as tool of customer dissonance mitigation and its impact in the manufacturing industry.
- It also emphasizes on learning diverse features of reverse logistics that how it act as a tool for customer satisfaction or dissatisfaction and how these characteristics affect the conclusions made by manufacturing organizations.

**Chapter 5**  
**Research Problem**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Research Problem**

Reverse logistics is a similarly new hypothesis and not until of late have researchers and logistics establishments attempted to focus on its effects on the official decisions. Also in New Year's customer satisfaction has been all around considered a significant component in the advancement of any business and the exertion on successful customer satisfaction has improved significantly. Recently researchers have start that reverse logistics can have a crucial influence in improving customer satisfaction.

The primary focus of this thesis is answer the accompanying questions:

- To understand the reverse logistics in changing business sector dynamics?
- What are the principle stages associated with reverse logistics?
- To understand the relationship between the customer dissonance and reverse logistics?

**Chapter 6**  
**Research Methodology**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Research Methodology**

#### **Research Design**

The research design states to the overall plan that we select to mix the different workings of the study in a logical way, thereby, confirming we will address the research problem: it establishes the blueprint for the collection, dimension an analysis of data.

#### **Types of research resources:**

Primary source of research that will be perform:

- Customer surveys
- Interviews

Secondary source of research that will be perform:

- Website
- Previous researches
- Through reverse logistics books and pdf
- Research articles
- Journals regarding reverse logistics

#### **Data collection**

The research is majorly based on collection of secondary data and hardly depends on any primary data collection.

Secondary data includes:

- Various international journals on reverse logistics and its risk
- Various reports and articles on customer dissatisfaction leads to reverse logistics
- Various reports and articles for analysis

## **Study of reverse logistics as a tool of customer dissonance mitigation**

- Various sources available on internet

### **Choice of Method**

#### Subjective Strategy

Abstract framework will be utilized for in light of the way that it's an adaptable technique for get-together the information. It covers few cases and all around getting some answers concerning those cases.

It perceives the customary canny model that is being utilized in the examination district and subject to this new research question will be framed. It additionally separates the social reality and the goal reality.

Passionate examinations filter for the "why", "what", and the "how" of subject through the examination of unstructured information by utilizing information gathering instruments. Acknowledgment, solitary social affairs, notes, photographs, accounts, recording the impacts and cause are the device that goes under enthusiastic method for information gathering.

### **Definition of research question**

The itemizing of research question will be founded on the discernment and past examinations that are being done on the subject and from that point on the request will be formed.

### **Motivation**

- Reverse logistics offer an approach to extract the most extreme incentive from products toward an amazing finish cycle. This involves the thoughts of reusing where conceivable, fixing when it is convincing, among other plans to cover the product's advancement.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

- Reverse logistics additionally serves a part of asset recovery by decreasing removal expenses of outdated products. Parts and merchandise can be returned to the first manufacturer to have however much worth extricated from them as could be expected before discarding the parts that are not, at this point recipient.
- Reverse logistics is a part of asset recovery likewise by increasing customer reliability. At the point when an organization focuses more consideration on the returned merchandise to figure out what the first issue was, customers will have a superior experience.
- When a machine or bit of hardware reaches the finish of its useful life, entrepreneurs can accomplish a second return on speculation. This is another way that asset recovery ends up being useful for business. On the off chance that the entrepreneur can sell the bit of gear, he stands to increase a second return on venture.

**Chapter 7**  
**Data Analysis**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Data Analysis**

Today Reverse Logistics (RL) has become a significant pushed area particularly in the field of aftermarket spare parts just as gadgets and PC hardware markets. RL is another pattern of big business methodology management and green supply chain management. RL is sought after for an organized improvement of economic and social productivity of the product.

Reverse logistics isn't just the establishment of roundabout economy, yet in addition had become the synergism with the development of a sound situation. Bayles depicts that RL empowers the reuse of disposed of products from business returns and management of overabundance stock of products and materials.

It involves processing merchandise returned because of harm, occasional stock, re-stock, and rescue, recalls and overabundance inventory. Reverse logistics management additionally envelops recycling programs, risky material management programs, out of date hardware disposition and asset recovery. The benefits of reverse calculated are regaining value. accomplishing an upper hand

### **Advantages of Reversal Logistics**

RL offers parcel of focal points to the organization as far as both huge and minor benefits.

In the principal case, companies are ready to rescue imperfect types of gear and parts which are either rescued or refurbished. The rescue reclaims the incentive out of the flawed parts.

Furthermore, the packaging and flawed materials are gathered and recycled, creating scrap an incentive for the organization.

Thirdly unsold and out of date types of gear are gathered back from retail location which energizes the distributors and stockists to purchase the stocks from the organization unquestionably realizing that they can generally return unsold stock.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

All things considered the distributors won't stop for a second to stock all quick and moderate moving goods also. According to the customer and society, the association stands to increase a decent standing and reputation of being a responsible organization on the off chance that it deals with the e squander and unsafe waste created. RL has been effectively altered in the western world as a marketing system. Refurbished PCs are sold at less expensive costs by every single driving brand and the demand for such PCs is by all accounts developing. The spare parts used by the PC manufacturers to service the workstations and PCs on guarantee or at a bargain, incorporate refurbished parts. Numerous electronic and buyer solid assembling companies offer to repurchase or trade the old types of gear from the customer when he plans to buy a brand new product. In shopper gadgets, the trade offers for white goods, for example, clothes washers and refrigerators are a success during markdown deal seasons.

Ere long, RL had not been truly considered by numerous associations which didn't have set up approaches, frameworks, human or financial resources to manage this issue. As of not long ago, little work had gone into concentrating how reverse logistics could positively affect an organization's main concern. The attention on RL is being affected, by supply chain upgrades, yet in addition, by legislation that puts the onus on manufacturers and retailers to securely discard unsold/used goods and be completely responsible for their products much after the useful life. Overseen in the right route there are different benefits which the organization will accumulate, past gathering legislation, by handling reverse logistics. By bridling and re-designing existing supply chains, there are chances to improve exactness, reduce expenses and track products that will limit loss of revenue because of broken, old or missing stock. At times, associations have considered approaches to reward workers for their keenness in recapturing the worth through the progression of products back however the supply chain. There are various quantifiable and substantial benefits that can be accomplished through the features and usefulness found inside a cutting edge RL arrangement.

### **These benefits are recorded beneath**

- i) **Profitability** One of the significant points in executing another RLM framework is to accomplish profitability through cost reduction and RL efficiencies. Benefits can be gotten starting from procedure, individuals, and stock by improving work productivity

## **Study of reverse logistics as a tool of customer dissonance mitigation**

and procedure effectiveness. This can be accomplished by limiting misfortunes from depreciation and shrinkage. Further, benefits can be accomplished by improving shop floor speed, improving returns stock usage and improving asset to money cycle time. By streamlining the coordinated effort over numerous suppliers and catching exact RL methodology and station tasks costs additionally benefits can be gathered. Benefits can be further gotten by improving regulatory consistence, customer punishment shirking, improving part guarantee qualification, processing return-to-vendor guarantee and track repair workmanship guarantee

- ii) **Customer Retention** Another significant addition of a progressed RL frameworks are increased service levels and improved customer fulfillment. RL keeps customers glad and returning. They actualize quicker, less complex returns processing and turnaround time for customers. They build up big business wide perceivability for customer request and asset following. They characterize, robotize, and standardize business forms for a predictable customer experience across product lines.
- iii) **Revenue Generation** RL encourages the manufacturer to set up and upgrade revenue generation programs. It is useful to streamline production forms and end-to-end perceivability. It assists with refurbishing and resell. It empowers the producer to sell with maintenance agreement services and expanded service contracts. Further it is advantageous to sell the product with adornments, updating and assists with intersection sell other products.
- iv) **Brand Equity** Advanced RL frameworks create "green" PR through recycling and supportability. Right now fabricate customer closeness. They improve relationships with suppliers and channels, adequately oversee recalls and ensure corporate reputation through legitimate regulatory consistence. Each phase of RL has a financial effect toward bringing down work and material expenses or increasing top line openings. The Financial effect of RL reduces or wipe out high work escalated and time expending assignments. The RL supply chain empowers an organization to all the more likely control, plan, and foresee service occasions. In such an atmosphere, the work power can work more effectively and acquire a more significant level of productivity. RL can likewise encourage an impressive reduction in material expenses

## **Study of reverse logistics as a tool of customer dissonance mitigation**

(for example stock) through perceivability and arranging instruments, real-time data following, following, standardized procedures and procedures and oneself observing of RL occasions.

- v) **Perceivability instruments** additionally give greater control and help to quicken the progression of returned goods all through the reverse logistics service arrange. This thusly permits the RL activity to reduce the general degree of interest in stock. Another advantage of these perceivability devices is that they empower the RL activity to have better data on the amount, disposition, and estimation of returned products. With this information, an organization can be more powerful in overseeing key procedures of the reverse logistics activity that effect income, for example, asset recovery and return to vendor (RTV) programs. RL can dramatically affect revenue development. Likewise, the organization can offer new service designs or maintenance agreements. Guarantee is as basic to recovering expenses for what it's worth to guaranteeing customer fulfillment. It can likewise be a gainful wellspring of revenues for companies that sell maintenance agreement programs. Successful and convenient handling of guarantee claims has the additional advantage of ingraining a feeling of certainty and quality with the customers.

### **Reversal Logistics Overlooked by the Manufacturers**

The significance of RL is regularly disregarded by associations. Numerous associations accept that RL is just a cost. This demeanor is misjudged. The utilizations of reverse logistics can add to financial, environmental and social benefits for the association.

Significant reasons concerning why associations disregard the significance of reverse logistics are

- Reverse costs are less obviously noticeable and therefore not viewed as a need.
- Organizations just gander at defective customer returns, not the all out volume of returned products, for example, end-of-life methodologies for products that are impeccably practical however replaced with more up to date forms of the product.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

Therefore these associations miss the absolute volume of reverse stream which whenever oversaw appropriately can prompt bigger increases.

- Many associations don't have the mastery, labor or infrastructure for processing returns and expanding to fire up another working arrangement of returns. These associations ought to consider redistributing the responsibility to a certified outsider logistics association (3PL).
- Reverse logistics is just observed as a cost to an association. In any case, it very well may be gainful. Reusing and recycling can regularly reduce costs.
- It is hard to forecast reverse progression of the product and to know precisely what and how much merchandise will be returned by the customer. Therefore return stream should be recorded and arranged with the goal that it very well may be evaluated and overseen successfully.
- Reverse logistics is regularly observed as more confused and less structured than the ordinary supply chains because of variety in product quality, imperfection rates and most extreme life expectancy. By creating structured stream way ways for different product situations the vast majority of these issues can be handled.

This standard intends to set up an environmental worth, reduce the negative impacts of nature on our wellbeing, stress the reuse of the current structures, materials and offices, and underscore the recycling of resources and materials which comprise of the accompanying targets.

- REDUCE squander material by recycling
- REUSE products and waste material
- REFUSE to purchase environmentally threatening products
- REFORM materials and use once more
- RECYCLE rather than scrap

## **Effect of the Returns Management Experience on Consumer Satisfaction**

**Study of reverse logistics as a tool of customer dissonance mitigation**

This sample was comprised of the two males and females extending from 17 – 30 years old. Counting such a differing gathering of people empowered the recounted experiences to incorporate online-explicit retailers, physical retailers, and experiences where consumers bought on the web and returned in store. The inquiries posed in each interview were one of a kind to every interviewee dependent on their 10 responses; be that as it may, the general system for each interview was comparable.

**Overall Experience Classification**

| <b>Experience</b> | <b>Responses</b> | <b>Percentage</b> |
|-------------------|------------------|-------------------|
| <b>Negative</b>   | 54               | 31%               |
| <b>Positive</b>   | 75               | 43%               |
| <b>Neutral</b>    | 48               | 27%               |

**Generalized Categories Mentioned**

| <b>Category</b>           | <b>Responses</b> | <b>Percentage</b> |
|---------------------------|------------------|-------------------|
| <b>Behavioral Changes</b> | 22               | 13%               |
| <b>Ease</b>               | 53               | 30%               |
| <b>Overall Experience</b> | 68               | 39%               |
| <b>Negatives</b>          | 33               | 19%               |

Table 3: Specific Variables Mentioned as Important

## Study of reverse logistics as a tool of customer dissonance mitigation

| Category                    | Responses | Percentage |
|-----------------------------|-----------|------------|
| Policy                      | 59        | 34%        |
| Customer Policy             | 29        | 17%        |
| Friendly Service            | 24        | 14%        |
| Ease of Return              | 19        | 11%        |
| No Questions Asked Policy   | 12        | 7%         |
| Return Label Provided       | 12        | 7%         |
| Prefer In-Store Returns     | 8         | 5%         |
| Quick to get Refund         | 6         | 3%         |
| Call Center Representatives | 5         | 3%         |
| Won't Buy Again             | 5         | 3%         |

### Areas of Importance for Customers

Furthermore, this information revealed the essential areas of significance for consumers. Of the citations pulled from the information, 33% referenced policy as a huge variable agreeable to them with product returns. Then, 29% referenced communications with customer service representatives being principal to a fruitful returns experience. At long last, 38% referenced the significance of having a straightforward procedure from buy to return to refund to acquire shopper fulfillment. These three factors are reasonably equitably circulated, demonstrating that every have a huge effect on customer fulfillment all through the returns procedure. This is particularly significant because 13% of the information referenced conduct changes coming from returns experiences.

### Effect of the return management on customer service

The expenses of disregarding customers are high, their value is increased by the way that disappointed customer enlightens a normal of individuals regarding it [Wanagos 2010, p. 7]. Returns happen when a customer is discontent with a product and needs to return it or to report a failure. Companies likewise manage returns toward the finish of the product life cycle when it is important to oversee them. As per Mesjasz-Lech „Returns are unsold products or products from which the customer has resigned, for instance, the Internet deals or direct mail inventories selling, returns of unsold papers" [Mesjasz-Lech, 2011, p. 4]. So as to decide the

## Study of reverse logistics as a tool of customer dissonance mitigation

spot of customer service in returns overseerment, it is critical to return to the product level from the marketing perspective.

Returns are a piece of the post-transactional components for which logistics corresponds. Logistics customer service, which incorporates return handling, is considered as the property of the all-encompassing product. As indicated by Coyle, the recognition of the customer service „as a product" is exceptionally compelling and assists with accomplishing an upper hand [Coyle, Bardi, 2002, s. 123]. The cutting edge customer doesn't purchase just the physical product or service, it is significant for him to work with the organization at the post transactional arrange. For instance, the customer's buying choices influences the capacity to effectively return the goods, particularly when the goods were purchased in the Internet. From the organization's side the circumstance appears to be unique, returns are expensive and time expending. It is assessed that the customer returns 5–40% of bought goods, and on account of list deals this number increases to 60% [Jeszka, 2014, p. 50]. As indicated by Sadowski [2010, pp. 109–110] the principle reasons that add to happenence of returns are: ⌘

certifications of return of goods by the customer inside a predefined time without bringing about any results (B2C), ⌘ returns of goods during the guarantee time frame, ⌘

returns related to product adjusting, repairs and replacement of spare parts, ⌘

returns related as far as possible of product life cycle (eg. renting period), ⌘

issues with the quality of completed products and work in progress goods, ⌘

the formation of waste or unused materials during the production arrange, ⌘

breached the security standards (withdrawal of goods from the market).

As indicated by Wanagos [2010, p. 11], „returns can be quantitative (delivered excessively or insufficient), subjective (goods don't have sufficient physicochemical properties) and

## **Study of reverse logistics as a tool of customer dissonance mitigation**

grouping (goods came not as ordered)". Every one of the issues mentioned by Wanagos is caused by customer disappointment which negatively influences the degree of service given by the organization. Having a positive experience during the return procedure from a specific seller, customer will probably make buy again and what is more he can recommend this seller to his companion. Lee [2015, p. 3] in his research on buyer conduct during the shopping was searching for the response to the inquiry – what are the fundamental intentions of consumers who return 100% productive goods? Topicality of the issue is affirmed by the following realities: ⚡ consumers increasingly return bought products before enough time has gone to test the product's performance or to survey its general quality, ⚡ by far most of consumers who return products are not trustworthy the quantity of buyer returns is increasing in times when the quality of the goods has been improved. While dissecting the returns from the shopper, Lee recorded the accompanying reasons: absence of assurance, truthfulness or numbness of consumers. Practically speaking, the circumstance has all the earmarks of being as per the following: a critical piece of returns happen simply because customers couldn't appropriately introduce or didn't have a clue how to use the product. To keep away from this problem, companies must deal with giving away from about the use of a standard ticular product on the flyer or on their site, in this manner instructing their purchaser. To understand how recalls can include value, it is imperative to characterize both marketing and calculated components of the procedure. From a marketing perspective, viable re-returns can improve customer impression of product quality, help limit buy hazard, increase organization value by adjusting the organization to the benefit of the resident, and therefore improve customer service. From the strategic perspective, re-turned products that are handled in a quickened way can be remembered for their current form as refurbished and regenerated products or as replacement parts. This can cause extra revenue, reduce working expenses and limit the expense of defective or damaged things [Diane, David 2005, p. 34]. Appropriate return management assists with improving customer service and increase damage ket intensity. For this reason, the counseling firm Strategies for Growth offers the accompanying guidance [Pollock 2007, p. 5]. Right off the bat, tune in and respond to the voice of the customer, recognizing what they are appreciating, and what can conceivably dishearten co-activity. It will assist with creating enduring discourse. Also, continually endeavor to envision customers' desires by foreseeing their necessities before they realize it without anyone else. Thirdly, attempt to understand that you can't manufacture a divider around your customers, accepting that because they were with the organization for quite a while, they will remain with it

## **Study of reverse logistics as a tool of customer dissonance mitigation**

forever. Fourthly, attempt to do everything conceivable to increase your reputation in the market. To wrap things up, situating the organization as a „interac-tive“, „active“ accomplice, however not as „proactive“ or „passive“ accomplice in collaboration with customers is of pivotal significance. This way to deal with consumers, not just as far as returns, will ensure fruitful business and faithful purchasers.

## **Effects of product life cycle and rate of returns on the RL network**

Marco Serrato gives the relationship of the product life cycle and pace of returns with reverse logistics organize in his paper "Portrayal of reverse logistics systems for re-appropriating choices". This area will outline his contemplations. Most products either flop in the beginning times of the product life cycle or neglect to keep up a steady growth.

The pace of returns relies conversely upon the length of the products life. For instance, in the PC market the introduction of new segments quickens the death of PC models previously presented, as the manufacturer must present new models (similarly as its rivals are doing) that will reduce the deals of the current models (Tibben-Lembke, 2002). Serrato refers to the six phases of the product life cycle to understand the reverse logistics stream. The six phases of the existence cycle as given by Tibben-Lembke (2002) in his paper "Post-existence: reverse logistics and the product life cycle" are: advancement, introduction, growth, maturity, decline and cancellation.

The significant issues that characterize the volume of the units returned through the RL framework for a product model, (for example, a particular model number of a specific product) during these six phases are:

### **Development phase**

It tends not out of the ordinary that there will be no returns at this stage, because the new product will have extremely minor changes from the current product, and customers who like the current product will clearly like a revised adaptation.

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Introduction phase**

Firms can hope to start making plans for managing the products that will in the end be returned at this stage. With the revised variant of a current product, firms can forecast the returns dependent on the trends for the current product. During the introduction arrange, the organization should likewise start managing the progression of the returned products. Because another model is frequently a minor adjustment of the current product, production challenges in adjusting to the new mode ought to be negligible. The minor change additionally implies demand for the new model would be relied upon to be fundamentally the same as demand for the previous model. On account of another model of a mainstream product, deals might be high from the earliest starting point or start little and develop rapidly, as customer demand for a set up, realized product is transferred to the new product. In these cases, Tibben-Lembke (2002) recommends that the product will avoid the introduction phase.

### **Growth phase**

Growth phase implies the business increase exponentially and so does the returns. This anyway may not generally be valid. As more customers are pulled in to the product, these new customers might be less learned about the product, and the pace of "non-flawed defectives" may increase. This thusly will likewise increase the changeability of the pace of returns.

### **Maturity phase**

As the deals of the product reaches maturity the pace of returns can likewise be relied upon to reach a steady phase. In retrospect, the volume of returns in any period is related not with the volume of deals in a similar period, however really with the recorded deals in the previous periods. Despite the fact that the business volume may have reached a steady phase, the pace of returns may really increase in the continuous periods.

### **Decline phase**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

Regularly it is hard to decide the finish of this phase of the cycle, and the reverse logistics needs to work till the finish of this phase. As the business decline the cost of the product in the secondary market likewise begin to decline, and subsequently these secondary market firms will be interested in buying the product.

### **Cancellation phase**

The volume of returns will keep on decreasing before halting altogether at this phase of the existence cycle. Regardless of whether the product has sold well, toward an incredible finish, retailers may send any unsold product back. Changeability in return rates influences the reverse stream greatly. Variable return rates implies the supply in the reverse stream shifts, and it is hard for any firm to stay aware of. Inventories must be kept up constantly, and stock is terrible for any organization.

### **Impacts of environment on reverse logistics**

Since we have a fundamental thought of Reverse logistics, right now the paper we will perceive what job reverse logistics has in the assembling scene, how the reverse logistics exercises influence different choices in an organization, and what sway these exercises and choices have on the earth. As referenced in the early pieces of this area many assembling firms frequently engage in improving their reverse logistics either they are forced by law to monitor their returned goods and arrange them securely or they are self-persuaded to keep up s green image among their customers. Whatever might be their inspiring variable, in future their logistics choices will be greatly affected by environmental impacts.

Discarding undesirable products is turning into a more firmly monitored movement. To a great degree this is valid for most countries on the planet. It very well may be seen that regularly companies situated in the US and European countries that have offices or have redistributed assembling occupations to nations like India, China and Thailand where the work is less expensive despite everything screen how these offshore destinations bargain the waste material that is created at these locales. Additionally they propose a specific standard for the redistributing firm which must be met. The exponential growth in the landfill costs in the US

## **Study of reverse logistics as a tool of customer dissonance mitigation**

and Europe can be credited to the regulations influencing landfills state Rogers and TibbenLembke (1998). The restrictions center around the assurance of human wellbeing and the earth as a result of which numerous offices have shut.

**Chapter 7**  
**Conclusion**

## **Study of reverse logistics as a tool of customer dissonance mitigation**

### **Conclusion**

In conclusion, returns and reverse logistics is a relevant issue in the supply chain. Because returns are an inescapable bit of the customer experience, retailers should misuse them for value, for example, increased lifetime customer steadfastness through positive returns experiences. This research has verified that the quality of returns experience has a direct correlation to behavioral changes that consumers make.

For instance, if retailers are underperforming and neglect to meet purchaser desires when consumers are returning products consumers are probably going to screen high-value buys and abstain from buying them at that retailer or abstain from buying at the negative retailer altogether. On a more positive note, the entirety of the information used right now that consumers have certain desires for returns and if those desires are met or 25 surpassed, customer dependability remains and, in specific cases, increases in buying patterns. For instance, those retailers that ensure the customer is left fulfilled have created life-faithful customers who are probably not going to keep unsuitable merchandise in their home as a reminder of their failure as a customer and the retailer's failure to give. This research has additionally established that the fundamental areas of firm differentiation when relating to returns incorporate the returns policy, returns procedure, and generally returns experience and customer service.

These areas have been formed into a model that tells not just the best way to meet and surpass desires yet in addition the behavioral changes that go with every area of shopper fulfillment. By following this model and the administrative ramifications illustrated in the content, retailers will have the option to recover a portion of the misfortunes experienced with returns and the reverse logistics related with them. They are additionally ready to use customer devotion and ensure that returns are not just an additional cost however are really a system of customer service.

This investigation is especially significant because as products become more standardized and the web levels most product differentiation, the service related with making buys turns into

## **Study of reverse logistics as a tool of customer dissonance mitigation**

the differentiator that directs a buyer to shop at a particular store. By having a positive returns process set up and guaranteeing customer fulfillment, retailers can give total customer fulfillment along the entire supply chain. This is particularly relevant as online returns and web based business keep on increasing, because when buys are made electronically, returns increase. By and large, this research gives the fundamental proof to retailers to change their viewpoint of returns. Rather than considering returns to be a failure and an additional cost, retailers should consider returns to be an area to improve customer service levels and affect increased customer lifetime value.

## Study of reverse logistics as a tool of customer dissonance mitigation

### Sample Questions

#### Opening

- Introduction of Interviewer
- Overview and purpose of study
- Assurance of Confidentiality
- Permission to audiotape

#### Initial Questions

- Tell me about a recent returns experience you have had?
- Why was the experience positive/negative?
- Can you contrast this experience with a positive/negative returns experience you've had recently?
- What would have changed your attitude on the experience (for negative)?
- What would you have liked to happen differently?
- Did you continue to purchase products from the company after this experience?  
How did your behavior change?

#### Additional Questions

- How did you make the return? (store-to-store, online-to-store, online-to-online)
- How much of an impact do returns services have on your likelihood to purchase in store? Online?
- What key elements characterize effective returns policies in-store? Online?
- Why did you return the product?

## **Study of reverse logistics as a tool of customer dissonance mitigation**

- Have you kept a product that was unsatisfactory? Why did you choose to keep it?
- What services do you expect with your returns?
- Does customer service while making returns influence you? How so?
