Case no: 1

Case title: man with lip and gingival swelling

Patients details and history:

A 51-year-old male patient attended clinic complaining of lip swelling. He reported that the swelling in the upper lip started 2 years ago but used to go away on its own. For the past few months, however, the upper lip became persistently swollen, and the lower lip started to swell as well.

He reposts a positive history of irritable bowel syndrome (for which he receives no medication). Upon further interviewing, he reported shortness of breath upon exertion.

Clinical examination

Extraoral exam revealed soft swelling of the upper and lower lips, associated with perioral erythema.
Intraoral exam revealed generalised gingival swelling.

Case no: 2

Case title: a man with a palatal swelling

Patients details and history:

A 49-year-old male patient attended clinic complaining of “abscess” in the palate that has arisen 2 months ago. He reports discomfort in the palate, in addition to tenderness when pressing on the left side of the nose. He self-prescribed antibiotics, which caused minimal improvement.

His medical history is positive for DM and hypertension. Both of which are well controlled. He is a smoker (2 packs/day). No known allergies.

Clinical examination

Intra-oral examination revealed a firm swelling in the palate with central ulceration.
