

Meeting Agenda [9th July]

I tried solving [Issue #3381](#)

Out of the four implementation tasks mentioned in the issue I was able to implement 3 of them
The last one said `make sure the version string gets updated automatically, using checker-framework-version and checker-framework-date magic
<https://github.com/typetools/checker-framework/blob/master/docs/developer/release/release.properties>`

I am able to read the properties present in release.properties which are tags of the form
<!--checker-framework-date--><!--/checker-framework-date-->. I couldn't figure out a way to make use of the tags and get an actual value like the current version of the checker framework.
