Kolab 16 Clients

Here is a list of the clients that work well with Kolab.

Microsoft Outlook 2013 / 2016

Configuration via IMAP.
Pros:
- It works

Cons:
- Manual account configuration.
- Lack of autoresponder -- need to set it in roundcube. Sounds like there may be a web page that we can direct uses to in order to set their OOF.
- What are the issues that people see with IMAP?
-

Notes:
Any thoughts?

Configuration via ActiveSync
Pros:
- It works
- Is there additional security? I know in Exchange I can quarantine a device by default until it gets approved.

Cons:
- Only a single Calendars?
- Shared contacts?
- Lack of autoresponder -- need to set it in roundcube. Sounds like there may be a web page that we can direct uses to in order to set their OOF.

Notes:

IMAP + CaldavSync?
Anyone using https://caldavsynchronizer.org/.   If so, what are the pros/cons?
Pros:
-

Cons:
-

It seems that Nextcloud is using the caldavsync as well.
https://nextcloud.com/outlook/
https://github.com/aluxnimm/outlookcaldavsynchronizer/releases

How are those calendars / contacts / tasks configured to sync into Kolab?

Thunderbird + Lighting

Email is always configured via IMAP

Cons:
- Delayed send is a client side feature. Thunderbird needs to be running for it to work.

Calendars/Tasks/Contacts

How are people configuring this for sync?
Tbsync & caldav/carddav provider

SyncKolab is dead

Roundcube

Pros:
- Nice looking client
- Provides full functionality of the kolab contacts/calendars/tasks
- Autoresponder (though people get confused about the naming (filter)

Cons:
- It is a web app

Kube

I assume this is going to be the best fat client available.
