The standard vehicle maintenance schedule

Basic maintenance

Many manufacturers recommend checking certain vehicle components after 30,000, 60,000 and 90,000 miles (the 30-60-90 scheduling model). However, some details, such as rubber gaskets, and tires, may wear unevenly and require periodic inspection at a reliable auto repair station near you. Other parts need a consistent maintenance schedule.

Regular maintenance

To prevent excessive engine wear caused by tiny particles of metal, dirt, and carbon that accumulate while the engine is running, you should make sure that your oil and oil filters are changed regularly. Non-synthetic oil, traditionally used in older model cars, requires changing every 3,000 miles. Today, however, most cars use synthetic oil, lasting 5,000 to 9,000 miles, depending on the type.

Maintenance based on mileage

Up to 30,000 miles

- Air filter: when driving on dusty roads or smoking in the car, it is recommended to replace the air filter closer to 15,000 miles of driving; otherwise, 30,000 miles is considered optimal.
- Fuel filter: after approximately 28,000 miles of driving, it is generally recommended to change the fuel filter to ensure optimal engine performance.

Up to 60,000 miles

- Transmission fluid: low levels can lead to shifting problems and transmission damage. You can evaluate the condition of the transmission fluid by its appearance and odor.
- Brake fluid: brake system bleeding and brake fluid replacement should generally be done every 18,000-40,000 miles at an auto service near you.
- Brake pads: good brake pads can last up to 50,000 miles. When it's time to replace them, they often make a loud squeaking sound.
- Coolant: schedule a coolant change after 60,000 miles to prevent engine overheating and damage.
- Battery: the average battery life of most vehicles is 4-5 years, with approximately 35,000-50,000 miles of use. Factors such as age, periods of non-use, and extreme temperatures can affect battery life.

Up to 90,000 miles

- Timing belt: should be changed between 70,000 and 90,000 miles to avoid catastrophic damage. Have the timing chain inspected at an auto service near you, as the chain links can stretch.
- Hoses: check and replace hoses as needed, especially as the vehicle approaches six-figure mileage.
- Power Steering Fluid: schedule a flush and fluid change after approximately 70,000 miles or if you experience steering problems.
- Ignition System: always pay attention to the "Check Engine" light on the dashboard, which may indicate ignition system problems.

These steps are general guidelines. Please, refer to your vehicle's owner's manual for a more accurate maintenance schedule. Also, keep in mind that aggressive driving can accelerate wear and tear.

By sticking to regular maintenance, you can avoid many costly repairs. Schedule your next visit to Clement Pre-Owned in Florissant, St. Louis, St. Charles, MO, for an inspection, maintenance, or repair. Let our experienced mechanics take care of your vehicle.
