Here are some ways to Optimize or Speed up Daz Iray Renders. It helps if you have an RTX card but even without it the following should help
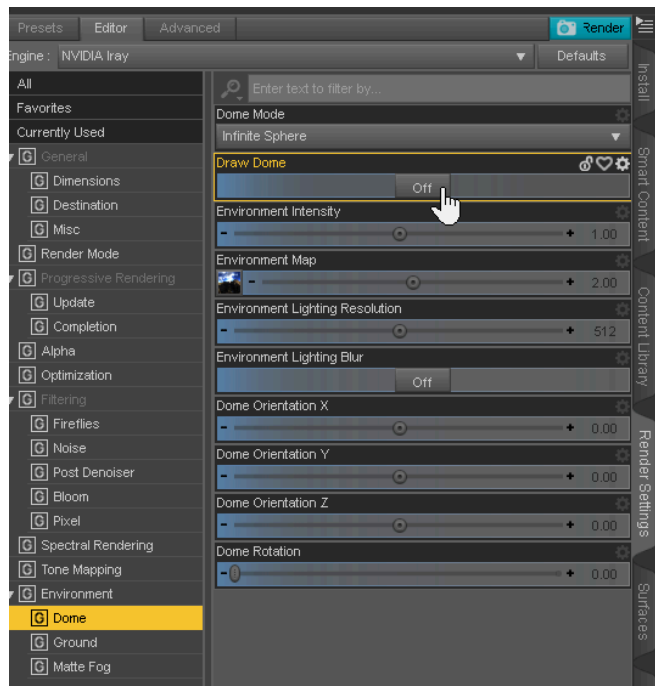

- Use Post Denoiser. This will speed the rendering a lot.

-Set Completion time to 10-30 secs depending on your hardware. On a 2080ti, with a single character 15 secs is passably good!

-Turn off Draw Dome and Render PNG sequence so that you can add background separately in editing software. You don't want to render backgound 3d elements unless you must.

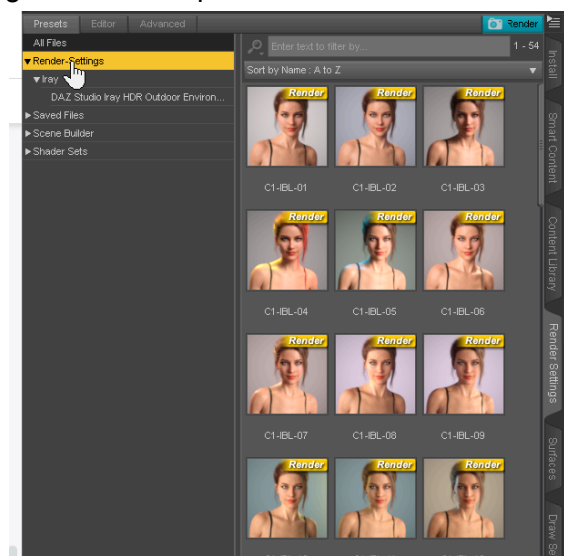

-Set Render type to Image Series and Series Base to ".png" Then composite a blurred background of your choice.

-Also try to render brighter lighted scene rather than dark scene to minimize noise. and Avoid using Fibermesh hairs or beard as they tend to take a long time to render. :)

-Use Tone Mapping to control exposure Viegnetting and Saturation, etc.. it makes it look so much better.

-Get "Click and Render IBL Set" lighting preset. it's really awesome and makes it easy to do great renders quick.

More coming Soon!
