Contents

Project Introduction

Zen Zone will be a relaxing life sim game that includes caring for and nurturing a unique set of plants as they mature. The player can:

- Take different forms as needed in order to water and fertilize their plants, as well as gather resources
- Interact with the different elements of the world surrounding them
- Rebuild ruined landmarks and restore the lands

The game is inspired by Stardew Valley, as well as the Plants vs Zombies minigame, Zen Garden.

Project Goals

The overall goal of this project is to create a prototype for a 2D- Top-Down game using Unreal Engine's Paper2D and PaperZD plugins. It's a side of Unreal that I haven't yet explored within a genre I thoroughly enjoy. Further goals are to create a relaxing atmosphere through the use of VFX, SFX and Music.

Challenges and Risks

Potential challenges working within this style include a lack of support from Epic Games – there is only a very little amount of documentation related to the Paper2D & PaperZD plugins. Even unofficially, there are only small amounts of people sharing information on how to best use these plugins.

Additionally, animation is something I've never attempted to do properly and in such a full fashion as I plan to with this project.

Hardware Requirements

- Requires a 64-bit processor and operating system
- OS *: Windows® 7 SP1 / 8.1 / 10 64-bit
- Processor: AMD FX-4350 / Intel® Core™ i3-3210
- Memory: 4 GB RAM
- Graphics: AMD Radeon™ R7 260X (2GB VRAM) / NVIDIA® GeForce® GTX 750(2GB VRAM)
- DirectX: Version 11
- Storage: 1 GB available space
- Sound Card: DirectX Compatible Sound Card

Platforms

Target Platform

This prototype will be created for PC as the platform has a massive marketplace for 2D Top-Down games, both on Steam as well as Itch.io. Movement controls for this genre are also better suited for mouse & keyboard, although it is feasible to develop it for console platforms.

Engine Specific Specifications and Limitations

As the game is 2D, and in a pixel-art style, there shouldn't be any egregious hardware or disk-space limitations. However, there are limited resources available regarding the creation of 2D games in Unreal Engine, as mentioned previously.

Engine Summary

This project is being developed within Unreal Engine 5.4.4, using the Paper2D & PaperZD plugins.

Optimisation and Profiling

Profiling Systems

Weekly systems reviews will be conducted to determine that the functionality of systems is working as intended, as well as ensuring that they have been programmed efficiently.

Additionally, regular playtesting sessions will be conducted throughout the project development timeline in order to stay on top of any bugs that may occur as well as having a second set of eyes to ensure that system functionality is as intended.

Profiling Graphics

In order to test graphical performance, I will test the in-engine performance of the project each time it is updated (1-3 times weekly). This will be done using Unreal Engine's 'Show Stats & FPS' tool.

Additionally, further details on graphic performance will be reviewed using the advanced details tab of this tool.

Coding Standards

Programming Standards

Conventional Unreal Engine 5 naming standards will be adhered to:

- Regular Blueprints: BP_(Name)
- Widget Blueprints: WBP_(Name)
- Animation Blueprints: ABP_(Name)
- Interface Blueprints: BPI_(Name)
- Game Modes: GM_(Name)
- Input Actions: IA_(Name)
- Enumerations: E_(Name)
- Tile Maps: TM_(Name)
- Textures: T_(Name)
- Sound Cues: SC_(Name)

There may be a few more I've yet to think of, but they will be named appropriately to ensure consistency across different blueprints in the project.

To optimize efficiency, several precautions will be considered when programming:

- Casts and bindings will be used strictly when necessary
- Event dispatchers will be used to communicate between different actors
- Is Valid? checks will be used to ensure any object retrieval works as intended
- Use of delays will be kept to an absolute minimum, and I will instead use Timers

- Any actors that implement the same functionality will be created as children of a base class so that repetition of code is minimized.

Style Guide

All blueprints will be neatened, aligned and commented once they are working as intended; this will help to ensure that they are as readable as possible for both myself (should I need to change anything) and for anyone else that may need to view the blueprints.

Additionally, events that need to run multiple times will simply be recalled as opposed to rewriting the event each time it's needed.

Commenting Rules

All major chunks of blueprinting will be commented in order to split them up based on their respective functions; this will help to ensure that any code that needs to be changed can be quickly identified as well as keeping the margin for error to a minimum.

To further the identifiability of different blueprint chunks, all comments will be colour-coded based on what their role within the blueprint class is. For example, chunks of blueprint relating to player inputs will be commented in light-blue, whilst chunks relating to gameplay functions will be commented in red. This style of colour-coding will be persistent throughout the different blueprints.

Code Review Procedures

As mentioned previously, code will be reviewed 1-3 times weekly (based on how many updates have been made to the project) to ensure that correct programming practices have been adhered to as well as to check for any possible optimizations that can be made for efficiency's sake.

Production Overview

Moscow

Must	Should	Could	Won't
Changeable character forms	Resource collection (wood & stone)	Unique environmental interactions	AI-based non-playable characters
Watering & Fertilizing plants	Rebuildable monoliths	Simple Tutorial with suitable animations	Objects/Stimuli that interact with the plants

3 unique growth stages for each plant 2 unique songs	Jukebox where the player can select songs Suitable VFX & SFX	A progress bar-based mini-game when watering plants Adjustable camera distance	

Timeline

Task	Start Date	Completion Date
Creating the base map, Character, Controls & Camera	18/12/2024	25/12/2024

Polish	12/02/2025	14/02/2025

Budgeting

The only money that will be spent on this project is for a 1-month subscription to CraftPix (£15) in order to gather the necessary 2D art assets for the project. Besides this, the project will cost nothing as Unreal Engine 5 is free to use.

In terms of man hours, the project will take roughly 150 hours' worth of time over the span of 8 weeks.
