

Project Requirements

Anti-Scrolling Blogging

Core Requirements

- Allow users to register and log in.
- A home page that displays the user's information and their posts (Home page).
- A page that allows the user to create a new post (Create Post page).
- A page that displays the entirety of a selected post (Display Post page).
- A friends page that lists the user's friends on the site (Friends List page).
- A page that displays the profile information and posts of a selected friend (Friend page).

Features we want to add if we have the time:

- The ability for users to comment on other's posts.

Initial Demo (04-Mar-24)

- Wireframe designs for the front-end application.
- Functional login and register pages.
- Home page displaying the user's information and their posts after login (potentially just using dummy data at this point).

WIP Demo (25-Mar-24)

- Completely functional home page.
- Users can create a post through the Create Post page.
- Tapping on a minimized version of a post brings up the full contents of that post in a Display Post page.

Final Demo (15-Apr-24)

- Users can add friends and can see their friends in their Friends List page.
- Tapping on a user in their list of friends brings up that friend's page in a Friend page view.

Things We WON'T Do

- We will not add the ability for users to interact with their friends' posts by liking or reacting.
- Additionally, we will not create a feed that shows the posts of a user's friends, this data has to be accessed through the friends tab by selecting a specific friend from the list.
- We will not create the ability for users to interact with each other through direct messaging within the site.
