Graphic novels, as the name suggests, are books written and illustrated in the style of a comic book. Adults may feel that graphic novels do not help children become good readers. They believe that this type of reading material somehow prevents "real" reading. (34)\_\_\_\_\_, many quality graphic novels are now being seen as a method of storytelling on the same level as novels, films or audiobooks. Many librarians and teachers are now accepting graphic novels as proper literature for children as they attract young people and motivate them to read. This has been especially true with children who are not (35)\_\_\_\_\_ to read, especially boys.

Language learners are also motivated by graphic novels because the pictures provide clues to the meaning of the words. Therefore, they will (36)\_\_\_\_\_ new vocabulary more quickly. (37)\_\_\_\_\_ teachers have reported great success when they used graphic novels with their students, especially in the areas of English, social studies and art. The idea that graphic novels are too simple to be regarded as serious reading is no longer valid. Reading them can, undoubtedly, help students develop the skills (38)\_\_\_\_\_ are necessary to read more challenging works.

Those who have studied bees have long wondered how they always manage to find their way home. No matter how strong the cross-winds are, they never seem to get blown off course. Now, however, biologists believe **they** have discovered their secret - by using radar to observe their flight patterns.

To do so, they **fitted** bees with tiny electronic instruments, which enabled the scientists to track all their movements over several kilometres. What this showed them was that bees seem to know exactly how far the wind is blowing them off course, and they react to this by adjusting their flight direction accordingly.

Aircraft pilots do something similar, using computers to calculate wind speed and direction. Bees, on the other hand, do the same thing by checking the position of the sun and watching how the ground appears to be moving below them. If the wind is affecting the way they are going, they change direction.

During this experiment, the researchers also discovered that the wind speed affects the height at which bees fly. On windy days, it appears, bees flying in opposite direction to the wind tend to fly lower than usual. This, they found, is because it normally blows more strongly higher up. Bees flying in the same direction as the wind, however, can use this to save energy by flying at greater heights.

***Read the following passage and mark the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions from 44 to 50.***

It is estimated that by 2050 more than two-thirds of the world's population will live in cities, up from about 54 percent today. While the many benefits of organized and efficient cities are well understood, we need to recognize that this rapid, often unplanned urbanization brings risks of profound social instability, risks to critical infrastructure, potential water crises and the potential for devastating spread of disease. These risks can only be further exacerbated as this unprecedented transition from rural to urban areas continues.

How effectively these risks can be **addressed** will increasingly be determined by how well cities are governed. The increased concentration of people, physical assets, infrastructure and economic activities mean that the risks materializing at the city level will have far greater potential to disrupt society than ever before.

Urbanization is by no means bad by itself. It brings important benefits for economic, cultural and societal development. Well managed cities are both efficient and effective, enabling economies of scale and network effects while reducing the impact on the climate of transportation. As such, an urban model can make economic activity more environmentally-friendly. Further, the proximity and diversity of people can **spark** innovation and employment as exchanging ideas breeds new ideas.

But these utopian concepts are threatened by some of the factors driving rapid urbanization. For example, one of the main factors is rural-urban migration, driven by the prospect of greater employment opportunities and the hope of a better life in cities. But rapidly increasing population density can create severe problems, especially if planning efforts are not sufficient to cope with the influx of new inhabitants. The result may, in extreme cases, be widespread poverty. Estimates suggest that 40% of the world's urban expansion is taking place in slums, exacerbating socio-economic disparities and creating unsanitary conditions **which** facilitate the spread of disease.

The Global Risks 2015 Report looks at four areas that face particularly daunting challenges in the face of rapid and unplanned urbanization: infrastructure, health, climate change, and social instability. In each of these areas we find new risks that can best be managed or, in some cases, transferred through the mechanism of insurance.
