H2 Professional Exosomes Hair Growth Treatment

Hair loss, hair thinning, and scalp irritation are common complaints from men and women alike. Research has shown that individuals with hair loss suffer from low self-esteem and depressed moods, which makes sense since our hair is often part of our identity. However, it's not always easy to keep thick, healthy hair once it begins to thin.

Hair transplants can be extremely costly and painful for the individual. Plus, messy, topical hair growth preparations are only mildly effective, even when applied daily.

At Sante Medical Aesthetics, we use human-derived exosomes injected into the scalp to revive the scalp and support hair growth. We have spent years treating hair loss with many different modalities and have found the most effective method for all patients, regardless of the concern.

If you would like to learn how exosomes can restore hair loss and rejuvenate your scalp, give our Naperville office a call at (630) 586-6244.

H2 The Benefits of Exosome Injections

Exosome treatments are a scientific breakthrough for scalp rejuvenation. Since hair-loss conditions are challenging to recover from, regenerative research has been massive in finding solutions.

With the use of exosomes, no blood draw is required for treatment. The quality of stem cells is universal to every patient, which means they are not dependent on blood quality or health status.

Anyone over the age of 18 that's looking for a way to solve their hair loss dilemma should consider the benefits of exosomes.

H3 Benev Exosomes

At Sante, our combination of exosomes includes 19 amino acids, 16 growth factors and peptides, and 4 coenzymes. **This all comes together with 350 billion exosomes per treatment for optimal hair growth results.**

Our skilled professionals use Benev exosomes for treatment. This new, advanced line of exosome products promotes optimal hair restoration, helping boost your self-esteem and self-confidence along the way.

From thinning hair to excessive shedding or hair loss, exosome therapy can help.

H2 Exosomes Hair Treatment FAQs

H3 What are Exosomes?

Exosomes are responsible for cell-to-cell communication and facilitating the exchange of RNA and other important proteins between cells (e.g., fibroblasts, keratinocytes, immune cells, etc.). They also transfer numerous growth factors, cytokines, and genetic materials that have shown signs of tissue repair to improve both skin and hair cells.

Exosomes therapy targets cells that can no longer do their jobs as well, helping them to regenerate for youthful results.

H3 Are Exosome Injections Painful?

On their own, patients might feel some discomfort with exosome injections for hair growth. **With our numbing technique, use of cold therapy, and distraction tools, most patients report the injections to be minimally painful.** Before you know it, you're back to your normal routine, and your cells will regenerate for lush locks.

H3 How Many Exosome Treatments Do I Need?

While everyone differs slightly depending on how much hair regeneration is necessary, you can expect three to five treatments. For full results, each session will be spaced four to

six weeks apart. After that, our hair specialists recommend maintaining your results with one treatment yearly.

H3 Do Exosomes Regrow Hair?

The purpose of exosome injections for alopecia is to jumpstart hair growth. Essentially, the older hair follicles that aren't performing well are exposed to exosomes derived from young stem cells. This provides the older cells with the necessary growth factors to regenerate.

H3 When Will I See the Results From Exosome Injections?

Most people see results after their first session around four to six weeks in the form of “baby” hair growth. **Full results will be seen after a complete hair regrowth package of three to five sessions.** Your results will depend on the number of sessions completed and how your natural hair growth responds to treatment.

H3 How Do I Prepare For My Hair Restoration Procedure?

A week before your procedure, you should stop taking blood thinners. Avoiding NSAIDs at least seven days prior decreases the risk of bleeding during treatment. It also helps speed up your body's response for a superior experience.

On the day of, be sure to eat a good breakfast before your appointment. Whole grains, leafy greens, and healthy proteins will set you up for success.

H3 What Is the Recovery Time for Exosomes Hair Treatment?

After each 20-30 minute session, it is normal for patients to go back to work the same day. Any discomfort or redness should subside within a couple of hours.

Some aftercare tips to improve your exosomes hair treatment include:

- Avoid excessive exercise/sweating for 48 hours
- Tylenol may be taken for soreness if necessary
- You may wash your hair immediately following injections
- Don't irritate the skin with exfoliants, shaving, or very hot water

H3 Can I Combine Exosome Therapy With Other Hair Loss Modalities?

Yes, you can! At Sante, we recommend patients use Nutrofol, Viviscal Pro, or Minoxidil in conjunction with exosome therapy for hair loss. Properly combining different methods to generate hair growth will increase the overall effectiveness.

H3 Are Exosomes Better Than Stem Cell for Hair Loss?

Exosome injections have more growth factors in their formula than stem cells. That means they are generally more effective due to potency. Both men and women experiencing baldness or moderate-to-severe hair loss can benefit from exosome therapy.
